

```
BROWSABLE"/>
    <category android:name="android.
intent.category.DEFAULT" />
    <intent-filter>
</activity>
```

Note: In the line `<data android:scheme="db-APP-KEY" />`, replace the APP-KEY with your application key obtained from the Dropbox site.

Also, you must specify in your *Manifest* file that your application will need to access the Internet. Hence, add an *INTERNET* permission in the manifest section, as follows:

```
<uses-permission android:name="android.
permission.INTERNET"></uses-permission>
```

Now, move on to authenticating the app.

Authentication

Before looking at the code, try and understand how the authentication takes place. You supply the app key, the secret app key and the access type, which you obtained during the creation of the app on the Dropbox page, to create a new session. Now, your app needs to be authorised through the official Dropbox mobile app or Dropbox mobile website. So, at this point, the user will be redirected to a page (Figure 1) that will request permission to access the user's Dropbox. Once the user accepts the app request, you will have the user's access token pair, which you can use to make various API calls. Once the app is authenticated, it will be redirected back to the activity it was executing before the authentication call. After control is returned, you must finish the authentication, binding the user's access tokens to the current session. It is also important to store these tokens somewhere after you obtain them, because if you do not, then the app will need to be authorised by the user every time it is restarted.

Here is the code for the above-mentioned steps. The comments specify which parts of the code correspond to each step.

```
//Create a new Session
private DropboxAPI<AndroidAuthSession> auth;
private final static String akey="INSERT-
ACCESS-KEY-HERE";
private final static String askey="INSERT-
SECRET-ACCESS-KEY-HERE";
```

Figure 1: Authentication

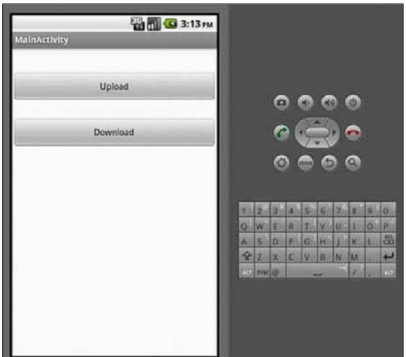

Figure 2: Dropbox App

```
private final static AccessType atype=AccessType.APP_FOLDER;
//Change to AccessType.DROPBOX if you selected dropbox access type.
AppKeyPair appkeys = new AppKeyPair(akey, askey);
AndroidAuthSession session=new AndroidAuthSession(appkeys, atype);
auth=new DropboxAPI<AndroidAuthSession>(session);
```
