

JUDCON, we talked about some newer technologies and we find that participants are interested in knowing the technologies in detail. We discussed technologies like the cloud and how it is being used across the globe. We have talked about being cloud-ready from the very beginning, in terms of footprints, energy consumption, etc. It's good to see questions around these from the audience. In India, a large number of people are updated about technology and we had some really intelligent questions coming our way. We got to know some interesting facts about the audience here. Bengaluru is No 1 in terms of using the technology. It's not just about continuing with the old technologies but also adopting the new ones. So on all these fronts, JUDCON India is a unique event.

Q You have JUDCON events globally. Which of the lot is the best and why?

Bruno: The best depends on both the speakers' perspective and the attendees' perspective. We have JUDCON in USA, Germany, China, India and many other countries. The rest of the JUDCONs are pretty local but the Indian edition of the event is a bit different as it caters to both the global as well as the local audience. Obviously, there are a large number of local customers, SIs and students. It was a wide spectrum of attendees that we saw but the reason I say that JUDCON India has a global impact is because it is huge in its size and the people who attend the sessions take away a lot for their customers. That's a unique differentiator for JUDCON India.

Q Sure, but I could see a lot of students around as well. What is the point of having students when it is such a high-level technology event?

Arun: You will be amazed at the level of open source education happening in this country. Java is taught in almost every institution. I have spoken to a lot of people who vouch for the fact that Linux and Java are taught in most of the Computer Science degree courses. In India, even people doing Electronics Engineering end up taking Linux or Java. So, for people who are spending their time and energy in understanding open source, such an event is an extension of that. Even in FUDCon we see enormous participation from people in education institutions. They are using Linux, which is a great operating system to teach at college because its source code is free. When I did my engineering, we only talked about device drivers. It was all theory. I could not look at the device driver code because there was no open source device back then. Things have changed drastically now and one can see the code to understand the concepts better. Apart from that, there is a demand from the academia that we should interact more with students to give them the real picture. So, it's not just restricted to the conference but goes beyond it. The students want to know the technicalities and want to add those details in their resumes as well. That is how they

"You will be amazed at the level of open source education happening in this country. Java is taught in almost every institution. I have spoken to a lot of people who vouch for the fact that Linux and Java are taught in most of the Computer Science degree courses."

look to market themselves.

Think about it from the market perspective. Let's look at the example of Sun Microsystems. The growth of Sun Microsystems was because of educational institutions. Students' participation is something that we welcome, and it's a great thing for us as we catch them here and nurture them to create a good workforce.

Q In one of your public speeches, you said you want to develop JBoss faster than the requirements change. How would you do that and what efforts have you made in that direction?

Bruno: We will develop reference architectures. We will develop tools that allow you to be proactive. Writing new code every time something changes is very cumbersome to me. So when you know the requirements, you go for different iterations. The requirements keep changing for many reasons, whether due to market changes or technological advances. So the lifecycle needs to be short. We know these paths and we work to shorten this path.

Arun: It's a function of automation. The biggest challenge for any software development organisation is how many times you reinvent the wheel. Any SI has to work to cut short the time for development, which has a direct impact on the ability of the business to respond to the market changes. India has a lot of regulation. So keeping in mind those regulation changes, we have to see how quickly we can adapt our applications to the changing environment. Think of customers in the insurance industry, who have to face a lot of regulatory changes. In that kind of environment, they have to be absolutely prepared for whatever changes that may come in. I think this is a new way of developing applications, which is far more agile and allows you to be more responsible as a business.

Q One criticism that comes your way is that JBoss is still tagged as a 'vulnerable open source application'. How do you defend that?

Bruno: Like any software, we also come across bugs but we fix them within no time. We have a mechanism in place as an enterprise to deliver the fixes to our customers. This is not restricted to just JBoss. This goes
