

Arush Salil:

I have a huge problem. I was moving some of my folders to my HDD and somehow the HDD cable just got plugged disconnecting the HDD in middle of the Transfer. Now I can't find my files anywhere. (Nor in the folder and neither it was in the HDD), whereas when I actually did a "Locate" for the folder, it actually listed the folder in the source place. But there is no such folder there. So where did my data just go? Can I somehow recover it back?

Ritesh Chaudhari: I think it's possible using testdisk.

Shivam Sharma: To recover the deleted files, you can also use *PhotoRec*.

Rajat Khandelwal:

I tried to install Fedora 18 Desktop Edition on my desktop but unfortunately it is showing an error "NO BOOTABLE PARTITION FOUND". Please help me!

Riya Patankar: I think you are trying on UEFI + Windows 8. Create a small 1 MiB partition in gpart and change its flag to bios_boot. Then try.

Rajat Khandelwal: What should I do with the partition?

Riya Patankar: Nothing just create it and set the flag, recently I had done the same for installing it with Windows 8.

Rajat Khandelwal: Sorry to disturb you! but now it's showing "No Partition Bootable In Table". I have tried both Fedora 32 bit and 64 bit many times but this error appears again and again. When I restarted my PC to run GParted it is showing the error "Invalid or damaged directory." I don't know why it is happening, tried many times.

Riya Patankar: Boot with live USB, and then run gparted, before all this answer one question: Is your machine having UEFI boot? If so, then you need to enable legacy boot support. (I haven't tried Linux with UEFI I tried with legacy only)

Rajat Khandelwal: I don't know about UEFI boot. Can you tell me how can I come to know whether my machine is having UEFI boot or not?

Riya Patankar: Go to bios and check for the options in the boot section. Are you running Windows 8?

Rajat Khandelwal: Yes, I am running Windows 8 and my PC is having UEFI boot disabled.

Riya Patankar: That means you are using legacy boot, cross check it. If you are using legacy, then follow bios_boot flag comment. Recently I had done the same with one of the HP laptops.
