

According to reports, the platform has been launched in China, where the demand for big-display affordable smartphones from Meizu, Xiaomi and UMI is higher than the demand for Apple iPhones.

The Smartisan mobile OS has been built to offer a more 'human' interface, which can be seen in the icons used, which clearly suggest that the traditional square icon style and grid layout have been discarded. But the company has reiterated that it believes in Apple's closed system set-up, and that it is capable of maintaining the quality control of the platform. By the looks of it, it seems Smartisan will adopt a similar set-up.

Firefox 20 comes with improved private browsing

The latest news is that Mozilla has fixed three critical security flaws in Firefox 20 and also released a number of new features with the latest update.

The major new improvements include per-window private browsing, a new download manager and the ability to close hanging plug-ins separately. While users

could earlier carry out private browsing with previous versions, they had to open a separate window to do so. However, with Firefox 20, users can browse privately without closing or changing their current browsing session.

The new update also allows desktop users a new Safari-like download manager, which pops

out from the toolbar. With this, users can monitor, view and locate downloaded files without switching to any other window. Coming to the three flaws that have been fixed, Mozilla's security advisories page has listed the following: a bypass of System Only Wrappers that can allow protected nodes to be cloned, a WebGL flaw which only affects Linux users using Intel Mesa graphics drivers, and a range of memory safety hazards, reports ZDNet.

The update is available for Windows, Linux, Mac and Android, and users can download it now from the official site. The Android version of the update is available through the Google Play Store.

Google brings the QuickOffice app to Android

After releasing the Office suite app, QuickOffice, for iPad users earlier, Google has now released the same app for Android and iPhone users.

Quickoffice, prior to Google buying the app, was recognised as a third-party app; so this is the first version to be launched after the buy-out.

Google has stated that QuickOffice is basically meant for business users, who still prefer the Office suite on their PCs, instead of more advanced Google Docs. With QuickOffice, users can create new Word files or edit them, make PowerPoint presentations or create Excel sheets on-the-move and save them all in Google Drive.

Apart from basic Office features, the search-engine giant

has enabled easy access to files from within the app itself. Users have to sign in with their Google Apps for the Business account and then they will be able to see files
