

workstation you use and a machine you will use as a server.

1. Create a password-less login environment for SSH. This is an optional convenience.
2. You will need to include your user in the audio group for reasonable behaviour of pulseaudio.
3. Create a file `.xinitrc` in your home directory as follows (using the KDE session):

```
start-pulseaudio-x11
# replace startkde by gnome-session for gnome desktop
ssh -X anil@server ".bash_profile; startkde"
```

4. In the `.bash_profile` on the server, add the following:

```
if [ "${SSH_CONNECTION}" ]; then
    PULSE_SERVER="${SSH_CONNECTION%% *}"
    export PULSE_SERVER
fi
```

5. From a terminal window, run the command given below:

```
$ xinit -- :1
```

So, what will the future of LTSP be?

LTSP is going to have to face the challenge of dealing with the current trend in desktops where the desktop effects are increasingly integrated into the window manager. In addition to the ability to run local applications, you can build a fat client with `build-ltsp-client`. This implies that the desktop manager and applications will run on the local diskless machine.

LTSP discussions continue to be very active and are an indication of the long term prospects for this project. In a recent discussion, it was pointed out that the issue with desktop effects is really an issue with OpenGL over the network. There is an exciting project called VirtualGL which may save the situation.

As software people, we should be thankful that every advance that breaks stuff brings us more opportunities for work and exploration!
