

“For modern day tablets and smartphones, Android has become a default,”

Indrajit Sabharwal, managing director, Simmtronics Semiconductors Ltd

Simmtronics is becoming one of the most frequently mentioned names in the world of smartphones and tablets. The Indian manufacturer has launched a series of Android devices in the past few months because of the growing popularity of the Android platform and the firm's capability to offer cut-throat competition to the other OEMs. **Diksha P Gupta** from *Open Source For You* spoke to **Indrajit Sabharwal**, managing director, **Simmtronics Semiconductors Ltd**, about the company's product line up and strategy. Read on...

Q Simmtronics seems to be banking big on the tablets market, despite having a presence in many other segments. What are your views on the tablet market segment in the country and how important is it for your business? Simmtronics is the only tablet OEM in India, which is making an Indian tablet in the true sense. We are manufacturing our tablet devices in our facilities in India. So, what we are offering is a truly Indian high quality product, unlike many other market players who import their devices from China. Besides, the tablet PC segment is where we will continue to see tremendous growth. Tablets are set

to take over PCs. They will soon become the biggest medium of content consumption. So as an OEM, to survive in this competitive market, we have to bring out products that are compelling. I think we are doing that successfully, with our range of Xpad devices. In fact, we have launched three tablets in April.

Q Can you tell us more about your recently launched tablet PCs?

Sure. We have launched two tablets called XPAD Simm-X722 and XPAD Simm-X802. The former offers a 17.7-cm (7-inch) capacitive touchscreen, multi touch G+G with 2G and 3G support. It comes with a SIM slot and is packed with 512 RAM DDR3 and 4GB internal memory. The tablet comes packed with the Android 4.0 (Ice Cream Sandwich) operating system, an A8 chipset, a 1.0GHz processor and a 3500mAh battery. Its USP is that it supports 2G calling and sports a sleek body, which makes it easier for users to carry around.

The XPAD Simm-X802 offers both 2G and 3G support and is a single SIM tablet. It sports a 20.3-cm (8-inch) capacitive touchscreen with a 800 X 600 resolution. The tablet comes packed with 512 MB RAM along with 8 GB internal memory expandable up to 32 GB. It runs Google's Android 4.0 (ICS) operating system and has an A10 Cortex A8 chipset. The XPAD Simm-X802 comes with a multi core 1.2GHz processor. The tablet comes with pre-loaded apps, including a Web browser, a super-HD player, music, a calculator, Gmail, calendar, play store, a clock, Youtube, a camera, a PDF file viewer, Documents To Go, a sound recorder, Skype, Gtalk, Latitude, Maps, Messaging, People, Phone, one browser, Stick cricket and Bigflix. It has a 4000 mAh battery.

Apart from these, we have introduced a quad-core tablet PC as well with the Android Jelly Bean operating system, which is being offered at a pretty affordable price. The tablet is the first-of-its-kind in the world. It is capable of playing four videos simultaneously...yes, users can view four videos on one screen, all at the same time.

We also have plans to foray into the smartphone segment with our products XPAD Smartphone X1 and XPAD Smartphone X2. While XPAD Smartphone X1 will run Android's Ice Cream Sandwich operating system, XPAD Smartphone X2 will run on the Android Jelly Bean operating system. These are single core and dual core smartphones, respectively, and we are looking at bringing out a quad-core smartphone as well.
