

Canonical releases Ubuntu 13.10 Saucy Salamander

For all the Ubuntu lovers, this is good news. Canonical has released the much-awaited Ubuntu 13.10 Saucy Salamander OS. The company says that the new version of the Linux distribution is the first step to mobile and PC convergence. The OS arrived on the same day as Microsoft's Windows 8.1 update for its Windows operating system.

According to Mark Shuttleworth, founder of Canonical and creator of the Ubuntu Linux distro, Saucy Salamander or Ubuntu 13.10 is a "...very significant push towards our first mobile devices." Shuttleworth told this to 'The Inquirer' ahead of the launch of the Ubuntu 13.10 OS.

Shuttleworth also said, "13.10 is the release that has the 1.0 of the phone experience for a range of supported devices, but it's also the release that precedes our major enterprise release so it has a full complement of the things we think will be right at the centre of enterprise IT for the next couple of years."

Ubuntu 13.10 has a number of new features including a range of mobile related apps such as a browser, clock, calendar, weather forecasts and calculator. In addition, there is Dash, which is an application that brings updates straight to the user's desktop. There are a number of other additions and improvements that come with the Ubuntu 13.10 OS.

GNOME 3.10 arrives

The 3.10 release of GNOME has been released and it brings 34,786 changes to the platform, with the highlights being experimental support for Wayland, a redesigned system status menu, new header bars for applications, support for high-resolution displays, smart card login support, and new applications for handling music, notes, maps and software installation. "GNOME has pioneered the development and support of code that is now core infrastructure for many diverse free desktops, including Dbus, accessibility support and Network Manager," said Matthew Garrett, Linux kernel developer and security expert, in a statement. According to reports, for the next major release, which will be GNOME 3.12, the developers will reportedly focus more on fully porting the desktop environment to the Wayland display server.

What's more, the GNOME 3.12 desktop environment will also offer support for Facebook photos in the GNOME Photos application. Additionally, there will be an independent GNOME software application to make the process of installing GNOME apps easy, integrate system support for the user session, and last but not the least, integrate Git in the developer experience.

Besides all this, the upcoming release will also have colour tinting support in GNOME Shell, Zimbra integration, along with video applications.

Google introduces the beta version of its HTML5 development tool

Since a while, HTML5 has been Google's favourite Web designing tool and to promote its acceptance amongst Netizens, the company has launched the beta version of its HTML5 development tool dubbed Google Web Designer. The company announced the release on the Google+ account recently and you can download the free software.

The product aims at helping users focus on the design while it handles the complex coding. If you are confident of HTML5 coding, the Web Designer also provides you with an option to write the lines of code yourself.

As HTML5 has been developed for animations, Google Web Designer has two modes of animation. In the 'Quick' mode you have to construct the animations, scene by scene, and it will handle the frames. However, the 'Advanced' mode allows you to animate distinctive elements by using layers. Google Web Designer makes use of CSS3 to create and control 3D animations. The designer holds assets from different creative suites including its own integrated illustration tools to produce vector-style artwork. At last, Google has ensured that you can publish advertisements without any additional coding, but with the help of DoubleClick Studio, AdMob or by using any other common option.
