

Valve brings Steam to the living room, announces SteamOS

Valve made a very interesting announcement, introducing SteamOS, a free operating system, which the company says has been "designed for the TV and the living room."

Online, Valve teased, "Thousands of games, millions of users. Everything you love about Steam. As we've been working on bringing Steam to the living room, we've come to the conclusion that the environment best suited to delivering value to customers is an operating system built around Steam itself. SteamOS combines the rock-solid architecture of Linux with a gaming experience built for the big screen. It will be available soon as a free stand-alone operating system for living room machines."

Valve also explained, "Steam is not a one-way content broadcast channel, it's a collaborative many-to-many entertainment platform, in which each participant is a multiplier of the experience for everyone else. With SteamOS, 'openness' means that the hardware industry can iterate in the living room at a much faster pace than it has been able to. Content creators can connect directly to their customers. Users can alter or replace any part of the software or hardware they want. Gamers are empowered to join in the creation of the games they love. SteamOS will continue to evolve, but will remain an environment designed to foster these kinds of innovations."

That said, 90 per cent of the employers also said it is tough to find professionals who are skilled in Linux and open source platforms.

Smart Launcher brings the Ubuntu Unity experience to your Android

Heard about Smart Launcher for Android, which offers you Ubuntu Touch's Unity experience on your Android phone? Reportedly, it consumes only around 7-8 MB of space and offers good performance when compared to other launchers.

Coming to the user interface, the left side of the panel has categories like *Settings, Utility, Media, Games, Internet and Communications*. The apps related to the category rest in that specific section. However, on the flip side, users cannot add an extra 'custom' section. But you can move the apps from one section to another by pushing, or dragging and dropping. Smart Launcher comes with a range of themes that can be installed via Play Store or even within the launcher under the 'Preference' option. This will directly take you to the Google Play Store. These can then be used within the app and the UI will be changed according to the theme you choose.

Report proves that several OEMs are cheating on benchmarks

In a pretty damning report published by AnandTech, it was shown that almost all big original equipment manufacturers (OEM) cheat on benchmark tests. According to the report, the devices function at their best only when certain benchmarks are running. For example, a device's CPU will run at its top speed only when a particular benchmark app, which the device has been optimised for, is run on it. These tactics are apparently also used in GPUs. According to the premier technology website, a number of devices were tested from smartphone OEMs like Samsung Galaxy S4, HTC, LG, Asus, etc. And only a few of the devices were 'clean' and had no sign of cheating on benchmark tests. These devices included the Motorola Razr I, Moto X, Nexus 4, Nexus 7 and the nVidia Shield.

The LG G2 was said to be one of the worst offenders along with the Asus PadFone Infinity (Qualcomm Snapdragon 800 version), which only perform at their best when the AnTuTu and Vellamo benchmarks are running. AnandTech tested with five other benchmarks, which ran without any hitches. A step ahead was the recently launched Samsung Galaxy Note 3, which was found to be cheating on six out of the seven benchmarks that were used.

Now play the 'Modi Run' game on your Android for free!

The Narendra Modi fever is catching on! Among the list of your favourites like Temple Run, Super Mario and Subway Surfers, you can now also make Modi run to see him win over India.

The game called Modi Run has been developed by Dexta, a mobile application and gaming company based in the US. It is a free game and can be downloaded on any Android device.

In the game, politician Modi is seen running through all the states to win the election and become the Prime Minister of
