

Google's new policy allows it to use our data freely!

Taking the privacy issues on the Internet to an entirely new level, Google has introduced new terms of service (ToS). These new terms have driven the discussion on cyber privacy and security in an entirely new direction. With these new ToS, Google can now allow your profile images and names to appear in reviews and ads. However, the company has clarified that it will not provide you any compensation for using such information for any commercial purposes. The search engine giant has also said that this will happen only if you +1 an item on Google+ or perform any other endorsing action. But Google users are not ready to view this new ToS in a positive way.

Google issued a statement detailing the changes, in which the company has stressed that the users will have 'full control' on whether they want to share their information through these endorsements. The statement reads, "On Google, you're in control of what you share. This update to our Terms of Service doesn't change in any way who you've shared things with in the past or your ability to control who you want to share things with in the future."

Google plans to show these endorsements across its platforms including Google Play, Maps and Search. The way it works is that if you rate an album or song on Google Play, your friends will be able to see your activity and any +1s given to businesses might be included in Search advertisements.

connected, the phone or tablet device goes back to normal. Through the new update, Microsoft has also changed the user interface for the app when used on tablets. Tablet users will see their conversations first, as a part of the change. This is done by putting up the most recent calls and Skype chats prominently in the application in order to allow easy access to the users. Skype version 4.4 also has improvements in the accessibility options. The app offers full support to users for the TalkBack screen reader. The update can be downloaded from the Google Play Store for no charge.

Linus Torvalds announces RC2 of Linux 3.12

Linus Torvalds recently announced the second release candidate of Linux 3.12. The new RC has a number of improvements in the open source graphics driver section, upgrades to various Linux filesystems, a lot of work on ARM, support for zRAM, an AMD Berlin APU and Snapdragon DRM/KMS drivers; revised version of SimpleDRM; full support for eLLC cache; and improvement to the Intel GMA-500 Poulso driver, among others. Torvalds wrote in his release announcement: "It's mainly driver updates/fixes (GPU drivers stand out, but there's networking too, and smaller stuff all over). Apart from drivers, there's arch updates (tile/arm/mips) and some file system noise (mainly btrfs). The shortlog is borderline too big to be really readable, but I'm appending it anyway." This version has been codenamed as 'Suicidal Squirrel' and we are hoping that Torvalds will be extremely busy this week, given that there will be scores of pull requests that will keep coming in.

CyanogenMod releases stable CM 10.1.3 build

The stable CM 10.1.3 by the CyanogenMod team has now been released for a number of devices. The CM 10.1.3 build can be downloaded from get.cm or by using CM Updates that is on your Android-based smartphone. CyanogenMod recently became a company (Cyanogen Inc) and this is the first release since then.

According to the official team, which developed the ROM, the new version includes all the features of the CM 10.1.2 ROM and adds the CM account facility to it. The CM account facility was limited to the CM 10.2 'nightlies' till now. Further, the CM team said that the 10.1.3 is the final release for the 10.1 code brand. CM will now be working on its Android 4.30-based ROM, that is, the CM 10.2.

The CyanogenMod release comes as quite a pleasant surprise, since the new developments in the company had led to people wondering when the next release would be out. Cyanogen Inc recently partnered with Chinese smartphone maker Oppo in September to launch a version of CM for the Oppo N1 smartphone. The phone will run the CM ROM, out of the box. The release date though is not known yet.

Red Hat Enterprise Linux 6.5 Beta is now available

Now, subscribers can download a new beta for Red Hat Enterprise Linux, and a final release will also be available soon. As anticipated, the release features several bug fixes and enhancements, some of which showcase just how influential Linux has become.

It's now a favourite hobby of many Linux enthusiasts to read through the 'maximums' in release notes. Here are some of their favourites from ZDNet's announcement of the RHEL beta:

"Administrative level scalability: Kernel dump files on large systems can
