

tool-monitor

obviously you should replace
localhost with a FQDN if you want to
run jobs from other machines.

```
export JENKINS_HOME=http://@sorins.  
uk.xensource.com:8080/export JENKINS_  
HOME=http://@localhost:8080/ java  
-jar /usr/share/jenkins/external-  
job-monitor/java/jenkins-core-*.jar  
"external-build-job-name" command-  
to-run java -jar /usr/share/jenkins/  
external-job-monitor/java/jenkins-  
core-*.jar "external-build-test" ls -l
```

Source: Jenkins plugin support page

Note that the script is for Debian/
Ubuntu Linux. You may need to change
JENKINS-HOME depending on your
environment. Once done, run the
following commands at the command
prompt to start monitoring:

```
$ export JENKINS_HOME=http://user:pw@
```

```
myserver.acme.org/path/to/  
jenkins/  
$ java -jar /path/to/WEB-INF/lib/  
jenkins-core-*.jar "job name" <program  
arg1 arg2...>
```

Source: Jenkins plugin support page

With this, you can expect mails sent
by Jenkins about the status of the job.

File fingerprinting

Software projects generally involve
many people working on multiple
files and so versioning is an uphill
task. Jenkins comes to your rescue
here as well. The file finger printing
feature lets Jenkins track which builds
created which jar file, which project is

using which jar files, and so on. This
feature works very well, especially in
big projects with a large number of
components. Note that this is an inbuilt
Jenkins feature and not a plugin.

To set up this feature, go to the
project, and click *Configure* on the left
side navigation panel. Then click on the
button to add post-build action. From
the drop down menu, select *'Record
fingerprints of files to track usage'*.
Here, you can select the file extension
types to be tracked by Jenkins.

We finish our series on Jenkins
with this. Hope this helps you in
setting up and using Jenkins for your
software development. Any questions or
feedback are always welcome.
