

Figure 2: BaaS ecosystem map

providers. But as already mentioned, in such a large ecosystem, it is quite difficult to come to a conclusion without having done an in-depth analysis of the service offerings. Hence, a different approach might help narrow down the choices.

Most times, the organisation needs to make the choice. MBaaS providers are of many different types, and range from open source to cloud-based. If your enterprise has sensitive data and you already have servers for the purpose, you could

look for a provider who would help you with an on-premise setup. But if yours is a start-up firm and you have no servers at your disposal, going for a cloud-based offering would be a better option. In case of enterprises, many MBaaS providers also offer connectors to major database management systems like Oracle, MySQL, MongoDB, etc. But more often than not, enterprises are reluctant to go for MBaaS providers, and it is the start-ups or independent developers who are their major clients.

Joe Chernov, vice president of marketing at Kinvey, says that “the ultimate selection criteria should be which MBaaS vendor allows developers to free up their time for creativity.” The MBaaS you use should help you reduce the effort and load that would have otherwise gone into managing things on the server side, and help you focus on other factors to make your app successful. If you end up choosing a MBaaS provider that increases your work load with a very complex API/SDK, then the very purpose of using MBaaS is defeated. **END**
