

Figure 3: Connection with MySQL database using JDBC

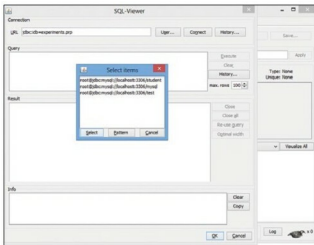

Figure 4: Setting up the MySQL database using JDBC

generates a one-level decision tree expressed in the form of a set of rules that all test one particular attribute. It is a simple, cheap method that often comes up with quite good rules for characterising the structure in the data. The algorithm indicates that simple rules frequently achieve surprisingly high accuracy. In this algorithm, just one attribute is sufficient to determine the class of an instance quite accurately.

Saving graphs and images in WEKA

Generally, we take screenshots of images/graphs to include the data interpretation and results in the report. WEKA provides the magic button **Alt+Shift+Left-Click**. The graph or chart can be saved in BMP, EPS, JPEG or PNG formats without taking a manual screenshot.

Though data mining algorithms are incorporated in many other free and open source software products, WEKA is used because of its user friendly standalone platform for data mining tasks including preprocessing,

clustering, regression, classification and visualisation. The support for various data sources can be extended through Java Database Connectivity, despite the default flat file format. The models in WEKA can be built using a graphical user interface as well as command line input.

WEKA is used by most researchers and practitioners as it possesses great flexibility in terms of platform, portability as well as embedded algorithms. The graphical user interface of WEKA is also very user friendly. Moreover, the Java based IDEs including Eclipse or NetBeans can also be used to customise WEKA. Generally, research scholars develop their own algorithms and want to test them on WEKA. For this, there are WEKA APIs that can be integrated in the Eclipse IDE for research and development.
