

Figure 3: The Deltacloud API - Web UI

Figure 4: The Deltacloud API - Web UI - EC2

supports a specific set of operations. The Web interface can serve as a proof of concept. You can verify functionality before creating an application that uses the Deltacloud RESTful API to create any feature which works across all cloud environments. You can create Bash shell scripting and Windows PowerShell scripting for Linux and Windows, respectively.

Use-case of Deltacloud API

The best possible case for an API that can be used with multiple cloud service providers is to create some customised application, which can implement customised features across various cloud platforms. It is also possible to create some desired features across all cloud environments if these are missing from certain environments. However, it is very essential to understand that the custom application may not have the best practices like those applied to a single cloud environment for feature development. **END**
