

"Our goal has been to make Hyper-V and Windows Azure the best for Linux. We're interested in whatever it takes—everything is up for discussion in order to ensure that our customers will have the very best experience when running Linux."

architectural. Each of these drivers has a 'To-do' file, which lists the current issues that have been identified as things to be addressed before the driver can exit the staging area. I would recommend starting with stylistic cleanup before jumping into more detailed architectural work.

Another way to contribute would be to help in testing and if you hit a problem, you can potentially come up with a fix that can be submitted as a contribution. Even if you cannot fix the problem, identifying the problem is also valued and is considered a contribution. Each day, one can download the Linux-next kernel, and try to build this kernel and test it, I would love to have people validating Linux on Hyper-V!

Q What are some of this year's top interoperability gains for customers?

Linux interoperability has been enabled through work across the company. Customers can run Red Hat and SUSE on Hyper-V. We worked with Canonical, OpenLogic and SUSE to enable Linux images to run on Windows Azure Virtual Machines with high performance. We teamed up with NetApp and Citrix, who helped us contribute some 8,500 lines of code so that FreeBSD can run on Hyper-V. All of that is possible, in part, because of the work we've done with the Linux kernel.

Q Has there been any critical feedback about this interoperability work with Linux?

The feedback we receive primarily focuses on what features and functionality customers want to see next and we welcome all that feedback. I don't think anyone really begrudges this – ultimately, the work is good for everyone who is involved.

Q What do you wish people understood about Microsoft's work with open source communities and with Linux, in particular?

That we are serious and not just putting in some code that is not up to snuff. We are committed to updating our code and bringing additional functionality. Our goal has been to make Hyper-V and Windows Azure the best for Linux. We're interested in whatever it takes—everything is up for discussion in order to ensure that our customers will have the very best experience when running Linux. 

Key Questions To Ask About Your Website

- ▶ Does it matter if your website has features that your competitors don't?
- ▶ Does the idea of new customers fit in your business plan?
- ▶ Would it help your business if you got enquiries from other cities and other countries?
- ▶ What is the cost of your (or your team's) time spent in managing a complex website?
- ▶ Where would you like your online showroom to be—somewhere mixed amongst millions of websites OR visible on a popular B2B marketplace?
- ▶ Does a marketplace visited monthly by 20,000 decision makers be a good marketplace for your business?
- ▶ How much would renting a showroom on Lamington Road or Lajpat Rai Market cost you? How does that compare with Rs 1500 per month that you would invest in eleB2B.com?

eleB2B.com
