

“What we are offering is an exquisite piece of innovation, where the difference is in the user experience”

The LG G2 is the next big thing from the Korean smartphone maker's design house. The company claims that its innovative technology, based on extensive market research, will help it gain an edge over its competitors. While it recognises that it needs an image makeover and has put a hefty budget aside for this task, the company believes that the technology and user experience it offers will drive growth. **Diksha P Gupta** from *Open Source For You* spoke to **Amit Gujral, deputy general manager, LG Electronics**, about the company's strategy for the Indian market. Read on...

Amit Gujral, deputy general manager, LG Electronics

Q This product was launched globally over a month back. Can you share with us what the initial customer response to it was?

The initial response to LG G2 has been phenomenal, globally. In fact, Korea was the first country to get the device, followed by the US. The back button concept that we have introduced in the device is an innovation that the world has not seen before, so it is gaining a lot of traction. To our knowledge, a smartphone manufacturer packing the power key, the volume key and the camera altogether at the back of the device, is a first of its kind from LG.

Q The LG G2 doesn't have any expandable storage. So do you have plans to add some cloud storage to the device in the future?

We have two variants of LG G2 in India—a 16 GB version and a 32 GB version. I think that will serve a lot of the storage needs of the consumers. In addition, we are offering 50 GB of box storage, free, for a lifetime to LG G2 customers.

Q Are you giving any accessories or add-ons along with the device as a launch offer?

For us, LG G2 is the biggest gift to the people of the country during the festive season. For a limited period, we have a quick window cover available free, for all LG G2 customers.

Q Will the G2 support 4G in India?

Yes, we do have an LTE variant of LG G2, but I am sure you agree with me that right now, the infrastructure in the country is not ready for 4G. But, G2 has been designed for the 4G environment to roll out globally where ever LTE networks are commercialised. So, as soon as 4G spreads in India, LG G2 variant will be available. It is 3G, as of now.

Q The design of G2 very closely resembles what Samsung is doing to its products. It is overloading features in its products and I am sure you will agree that there is an equivalent of the quick window cover for Samsung's devices as well. Like Samsung phones, LG G2 is a plastic phone with over bundled software and every feature that one can think of. Or is it something unique coming from your production house?

In simple terms, my answer is 'no'—we are nowhere related to how any other brand brings out its devices. What we are offering is an exquisite piece of innovation, where the difference is in the user experience. LG G2 has industry's first 13 MP OIS (Optical Image Stabiliser) camera and lifestyle and ease enhancing user experience features. This all is governed by our extensive consumer research what we call—“Learning From You!”
