

LG G2: The latest from LG

LG G2, the latest kid on the block introduced under LG's new 'G' series of premium devices, is designed on insights derived from LG's study of consumer lifestyle and behaviour. The 13.2-cm (5.2-inch) smartphone is equipped with Qualcomm's Snapdragon 800 processor and runs Android Jelly Bean. It sports a full HD IPS display, which ensures superior graphics, accurate colours and clear images without any distortion. For more efficient energy usage, the LG G2 employs Graphic RAM (GRAM) technology, which reduces the display's energy use by up to 26 per cent on a still frame and increases overall usage time on the device by approximately 10 per cent. In addition, LG's Dual Routing technology reduces the phone's bezel to a mere 2.65 mm on the side edge, which results in the maximum view ability.

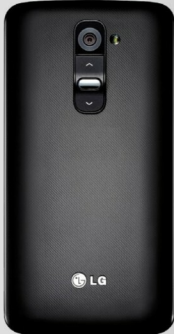

It is the first mobile phone completely devoid of side buttons. Other noteworthy features of the device include studio-like sound quality, improved graphics and good battery efficiency. The phone has a unique privacy feature that sets two pattern locks, thereby allowing only a limited interface for guest users. Apart from this, unlocking the phone has never been this easy – all it needs is for you to knock on the display twice. These every day and most-used features have been given a twist to make it convenient for customers.

The G2's unique placement of all the buttons on the device's rear side came from the insights drawn from an LG study called 'Learning from you'. The study showed that placing the index finger on the back of the phone is how most people naturally hold the smartphone as it is the most comfortable and stable way to do so. This is why the company has placed the keys on the back of the phone so that users are able to control both the power and volume buttons with the index finger. This makes the handheld experience of a phablet much easier and more convenient. Researchers found that moving the buttons resulted in fewer dropped phones when adjusting the volume while talking. The rear volume keys are also multifunctional and 'long-pressing' them launches the QuickMemo app and the camera.

The LG G2's high-resolution 13 MP camera comes equipped with Optical Image Stabilizer (OIS) technology to prevent blurring. This also allows users to take pictures of objects in motion that are as clear as if they were still. G2 allows dual-recording with its 13 MP back and 2.1 MP front camera. To add to it, G2 has a sapphire crystal glass. It is also the first smartphone to feature 24 bit/192 kHz Hi-Fi playback that reproduces studio-like quality sound. Consumers can now experience a level of audio realism that was earlier not possible in a smartphone.

LG G2 comes with a number of compelling user experience (UX) features. If the G2 is lying on a surface face-up, its KnockOn feature helps the smartphone to be powered on by simply tapping twice on the display. The Guest Mode feature protects privacy as it sets two pattern locks. It allows the owner to set up a sort of guest interface for people who want to experience the phone. Using Guest Mode, the owner can secure important files and deny access to certain applications. The Text Link feature allows information embedded in text messages to be selected and easily saved in a memo or calendar, and searched on a map or the Internet. The QuickRemote app transforms G2 into a universal remote to control popular home entertainment devices and operate multiple devices. Slide Aside enables easier multitasking by simply 'sliding' open apps off to the side, with a three-finger swipe.

The LG G2 is priced at Rs 41,500 (16 GB).

Q In the last six months, you have introduced some really good products. But your market share doesn't seem to have improved.

We have launched Optimus Vu, Optimus G and Optimus G Pro, and have received phenomenal acceptance among the consumers. I believe LG G2 will create another success story for LG India's smartphone business.

Q Last year you have launched Optimus G, which used a premium glass body, but this year you are back to glossy plastic with the G2. Why did you decide to shift back to plastic, because at a price point of above Rs 40,000, consumers might not appreciate it?

Before launching the product, we conducted research with thousands of smartphone users, during which we asked them
