

about their behaviour, lifestyle, needs, et al. Any decision, whether to use glass or plastic, is not a single unilateral decision. It comes with the consumers' insights. I won't be able to comment on why we have not used glass but I can surely tell you that every product is based on heavy research.

Q What kind of market share are you planning to grab with G2?

I can tell you our goals for next year. We are pretty sure that we can get 10 per cent market share for 2014 in India. For G2, specifically, we plan to hit about ₹ 2000 million in sales.

You can make out what share does this indicate. I am pretty sure that it will give us an immense momentum to increase our market share substantially.

Q Do you think you will bring out LG G2 like features (including the power and volume buttons, as well as the camera at the back) in the other smartphones as well?

Well, as I said, whatever we have introduced in G2 is a result of innovation based on market research. We will obviously want to leverage on the research insights as much as we can. These features are being appreciated across the globe and we will not mind extending them to the other devices, in time.

"I can tell you our goals for next year. We are pretty sure that we can get 10 per cent market share for 2014 in India. For G2, specifically, we plan to hit about ₹ 2000 million in sales. You can make out what share does this indicate. I am pretty sure that it will give us an immense momentum to increase our market share substantially."

Q On a couple of previous occasions, we have seen that LG has not been able to bring out its products in India on time and there is reportedly a delay in the Indian launch of the new series of devices. With G2, you seem to have been successful in reducing the gap between the global and India launch. Will you continue with the same strategy for other devices as well?

Our efforts are totally aligned to bridge the gap between global and India launches. And I think G2 is surely a testimony to that. Soon after we launched the device globally, we brought it to the Indian market as well. So we are looking forward to such alignment in the future as well. We have to understand one peculiarity about a market like India. It is a huge country with a vast variety of networks operating. The amount of time and energy required from our end to launch a quality product, tested across Indian

"Our focus since 2012 is to increase our network and today we have associated with all the big names across the board. So right from our G launch and then G Pro, we have been catering to almost all the top cities of the country."

networks is immense. To achieve the ideal situation, we can further invest more in R&D and have parallel testing in India as well as in global markets, but it is not an easy task. That is why there is a gap between the global and the India launch. And I am sure our consumers appreciate the quality delivery via our products.

Q LG Mobile has been in the country for a long time, but the company has barely a 2-3 per cent market share. What are you doing to improve the situation and do you see things changing with LG G2?

I believe that for any business, the key success factor is the product it offers. With G2, we believe that we will be able to set the momentum for growth in India and I think the festive season is just the opportune time for that. Globally, we are starting to see that LG's phone market share is growing and LG is No 3 Smartphone selling company globally. So we are hopeful that the rally will continue in India as well.

Q Your go-to-market strategy doesn't seem to be working for you since a long time. Recently, you said that you will spend Rs 1000 million on market and channel partners. Can you elaborate on this?

Our focus since 2012 is to increase our network and today we have associated with all the big names across the board. So right from our G launch and then G Pro, we have been catering to almost all the top cities of the country. By now we have a good set-up and with G2's launch, I am sure this will grow further.

Q You have used a new chipset from Qualcomm in this device. What kind of performance enhancements should one expect from this new chipset?

Qualcomm's Snapdragon 800 doesn't need an introduction now. It is one of the pioneering chipsets to run at 2.26 GHz per core without eating up the battery of your device. A chipset is about the experience that is ultimately delivered to the customer. So we firmly believe that our prime concept is a 'delightful consumer experience'. This chipset is faster than any other available option and provides the ultimate experience to the user. The fact that it eats up less battery makes it ideal for high-end devices, on which users typically do a lot of multitasking.
