

Buying Bitcoin in India

While mining Bitcoin is definitely not for everyone, there are some places where you can buy Bitcoins at a value pegged to the US dollar in the popular Bitcoin exchanges like Mt Gox, etc. Some of the places you can buy Bitcoin in India are:

- BuySellBitco.in
- Mt Gox
- LocalBitcoins.com

Of these, BuySellBitco.in is the only exchange in India which accepts payments through Net banking, IMPS and cheques on ICICI Bank, Axis Bank and SBI. Localbitcoins.com is a website that lists traders who are ready to sell Bitcoins in your local area at a specified price. Mt Gox is an American exchange that allows you to specify bids at a specific price, provided you are able to fund your account through international wire transfer, which would prove to be quite expensive and is recommended only if you intend to trade in very large denominations.

I have not covered too many technical aspects of Bitcoin, since this article only aims to provide you with

an introduction to it. This is something which is bound to be a part of your future. While the future of Bitcoin is still not secure, one thing is for sure—the idea itself has changed the way we think about money and even if it fails to be as popular as we expect it to be, peer to peer cryptographic currency is bound to be a part of the future economy.

The author is a geek with a crush on Java and loves firling with almost anything related to databases and Web technologies. Feel free to poke fun at his articles and direct your feedback to ankitloaded@gmail.com.

Continued from page 90...

Figure 5 illustrates this.

Now, if we want to get the interpolated values at the points 1.5, 3.8 or 10, instead of giving all the intermediate points x_i in the above code, we may just give these three. Here is the code for it:

```
octave:1> x = [1 2 3 4 5 6 7 8 9 11];
octave:2> y = [1 2 3 2 1 3.75 7 3 0 8];
octave:3> our_x = [1.5 3.8 10];
octave:4> our_y_n = interp1(x, y, our_x, "nearest")
our_y_n =
```

```
2    2    8
```

```
octave:5> our_y_l = interp1(x, y, our_x, "linear")
our_y_l =
```

```
1.5000    2.2000    4.0000
```

```
octave:6>
```

Before concluding on interpolation, just to give you a feel of all of the interpolation techniques, here is an example with the points on a sine curve:

```
octave:1> x = 0:2*pi;
octave:2> y = sin(x);
octave:3> xi = 0:0.1:2*pi;
octave:4> y_n = interp1(x, y, xi, "nearest");
octave:5> y_l = interp1(x, y, xi, "linear");
```

Figure 6 shows the visualisation of this.

What's next?

With today's curve fitting and interpolation walk-through, we have used some basic 2-D plotting techniques. But there are many more features and techniques to plotting, like marking your plots, visualising 3-D stuff, etc. We'll look into that next.
