RS Khandelwal: Hey my PC is dual booted with Windows 8 and Fedora 18. Now I want to uninstall Fedora from it. So, can somebody tell me the steps to uninstall it?

Like · comment

Nirdy Hird: Boot into the Windows 8 DVD. Choose Repair, then Troubleshoot, Command Prompt, and then type "bootrec.exe /fixmbr". That will get rid of the non-Windows boot loader and boot back into Windows. Then just clean up the partitions by deleting them and reclaim the space back to Windows if that's what you want or use that blank space for a better Linux distro.

Swapnil Katore: Boot Windows 7 or XP CD and delete the two partitions. Keep NTFS partition untouched and then restart your PC.

Sarfaraz Alam: Yes this is the right way to uninstall any Linux distro which has dual OS.

Utsav Rana: Back up files from Linux and put it in the safe place. Now go to Disk Management in Windows. On the left hand side you see disk management and there you will find the partitions that have no names to recognise that is the Linux partition. Just right click on the partition you want to delete and select the delete partition command. Be sure to select the right partition.

Dave Carroll: Nope, get rid of Windows 8. Your computer will run much better.

Matthew George Ford: Sorry Dave I can't let you do that.

Saurabh Sharma: Delete Fedora partition. Then boot from the Windows CD. Open CMD and type bootrec/fixmbr to remove grub.

Praveen Kip: Delete Linux installed drive.

Prasanna Mohanasundaram: Restore the MBR to load Windows and simply delete the Linux partition in disk management.

Muhd Afif: The laziest way is to use disk management in Windows 8 and format the Fedora partition to NTFS but grub will still exist though.

Asmita Metrewar: Is it possible to install Ubuntu Touch on Samsung Galaxy Y running Android 2.3.6?

Vaibhav Singh Gour: Not possible.

Vinu Lal: Why do you need to install Ubuntu when you have Android on your phone? Upcoming Ubuntu Edge will let you to use both Ubuntu touch and Android as a dual boot.

Asmita Metrewar: I just wish to try it out. By the way, Ubuntu Edge is yet to make its way to mass production.. Long time to see it..

Rajat Khandelwal: Hey my pen-drive got write-protected and now I cannot delete and save my files in it. Can somebody tell me the way to remove it?

Utsav Rana: Format the pendrive in Linux live mode. This should work fine.

Gokulnath Avanashilingam: Mount or remount, `rw /dev/sdXX` (XX would be your pendrive mount device like SDAL or SDB1)..

Riya Patankar: Buy a new one.

Abhilash Thekkan Thottathil: Any good command to know about what's stored in inodes? And where do these details get saved?

Like · comment

Anand Kethavarapu: Is -li should display about inode and file details. These details are stored in the inode table.

Abhilash Thekkan Thottathil: Thank you Anand. Is -li would display the inode number. I want the command to display the contents of that inode.
