

The world's first triple-SIM Android phone is out

Is dual-SIM not good enough for you? Well, don't worry. Chinese smartphone maker, GooPhone, has announced the launch of GooPhone X1+, which is being touted as the world's very first Android smartphone that provides triple SIM support.

Various Chinese news sites have posted the pictures of the GooPhone X1+ with its rear cover removed, showing off the three SIM slots, while pictures of the front face showcase the three signal strength bars.

Sources suggest that the X1+ will be available for sale in China and other emerging markets starting from the end of this month. The device is powered by a Mediatek processor clocked at 1.2 GHz with 1 GB of RAM and 4 GB of memory.

The device has been priced at US\$ 150 on some retail websites.

Open source software is being used in the world's smallest drone system

The world's smallest drone autopilot system chip has turned to open source, opening the technology for anyone who wants to use it. The makers of the Lisa/S chip, which is 4 square cm in size and weighs only 1.9 grams, have opened both its hardware and software to the public.

Originally, the software used in the chip was based on another open source drone autopilot system known as Paparazzi. But the Lisa/S presents the added incentive of ingenious hardware. Even though it is tiny, the chip has everything including a gyroscope, accelerometer, altimeter, GPS and even an ARM processor. In fact, the processor is very similar to a smartphone processor.

Having said that, the world's smallest drone autopilot system does have its limitations.

who travel by train or airplane, but also for Delhi Metro commuters. The Delhi Metro Rail Corporation (DMRC) has now rolled out an app for both Android and iOS devices. The app will help commuters look for the nearest Metro station, travel fares, timing information, parking information, the travel time for their journey, Metro route information and the Metro map.

Additionally, it will offer information on landmarks and tourist spots near Metro stations, the addresses and contact numbers of the 'Lost & Found' cell, details of feeder bus services from these stations, information on the Metro Museum, and DMRC helpline numbers, etc.

Commenting on the app, the statement from DMRC reads, "These applications will, therefore, help the passengers to view information related to the train services of DMRC and related information on their own. These key functionalities will make up the home screen of the smart phone application of the user. Using the tabs available on the home screen, the user can navigate to the desired section/feature and get the required information." Those interested can download the app from DMRC's website (www.delhimetrorail.com).

Android users can now view reports of incidents as they occur in real-time, on Google Maps

Google recently acquired Waze, leaving its customers wondering what to expect next! Google has announced that Android users of Google Maps will now be able to view reports of real-time incidents made by Waze app users.

Commenting on the announcement, a Google blog post reported, "Users of Google Maps for Mobile will now benefit from real time incident reports from Waze users. This means when Wazers report accidents, construction, road closures and more on Waze, the updates will also appear on the Google Maps app for Android."

As of now, Google is rolling this feature out in select countries first, before it is made available across the globe. The countries that will get the update first include United States, UK, Argentina, Brazil, Chile, Colombia, Ecuador, France, Germany, Mexico, Panama, Peru, and Switzerland.
