

Facebook launches Internet.org to take the Internet to 5 billion people

After being on a mission of connecting the world for nine years, Facebook aims to take connectivity to an entirely new level, with its new-found partners. Facebook has joined hands with global companies like Ericsson, MediaTek, Nokia, Opera, Qualcomm and Samsung to take Internet connectivity to 5 billion people around the globe.

Making an announcement about this via Facebook, Zuckerberg wrote, "For nine years, we've been on a mission to connect the world. We now connect more than 1 billion people, but to connect the next 5 billion we must solve a much bigger problem: the vast majority of people don't have access to the Internet. I'm focused on this because I think it's one of the greatest challenges of our generation. I've attached a rough plan I've written outlining the work Facebook is doing to solve this and how our industry can work together to connect the next 5 billion people."

Zuckerberg believes that, "Everything Facebook has done has been about giving all people around the world the power to connect. There are huge barriers in developing countries to connecting and joining the knowledge economy. Internet.org brings together a global partnership that will work to overcome these challenges, including making Internet access available to all those who cannot currently afford it."

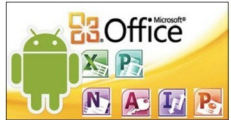

Waze has revealed that these incident reports that appear in Google Maps for Android will not be recording Waze user profiles but Wazers will still get points for their reports.

MS Office for Android now in India

Do you use an Android phone and miss the Microsoft Office software? Now, there's good news in store for you! Microsoft's Office Mobile for Android phones has finally been announced for key Asian markets like India and Singapore. The announcement has come nearly a month after the product was launched in the US. Besides this, the app will also be available in Indonesian, Japanese, Korean, Simplified Chinese and Traditional Chinese—making it available in 33 languages altogether.

This new launch allows users to access, view and edit files in Microsoft Word, Excel and PowerPoint, and is also optimised for the small smartphone screen.

Among the key features of the app are 'Resume Reading', which when opening a Word document from SkyDrive on the phone, automatically resumes at the place where the user had stopped earlier, even if you last viewed it on other devices such as a PC or tablet. The introduction of the app in new markets will help Microsoft drive traction in the mobile space, as it looks to cater to users on the go, on various platforms.

KDE Connect lets you sync Android and Linux desktops

Guess what! Your Android phone can direct notifications to your Linux desktop. In fact, there are many different ways to do this. But, KDE Connect is perhaps the best way to do it. The application is a Google Summer Of Code project. It has features like the phone battery status integrated into your laptop so that you can view that alongside the laptop's battery status. In addition, you can also do things like getting phone notifications on the desktop and even sync the clipboard content between the two devices. The app currently runs only on a Wi-Fi connection but, according to the company, more options like USB cable and Bluetooth will soon be made available. Currently, the app is in the pre-beta testing phase but seems worth the wait. All a user needs to do in order to install the app and run it, is to install KDE Desktop and have an Android 4.2 OS and above.

More than 10,000 developers contribute to Linux!

Ever guessed how many people actually work towards writing Linux code? Well, the figure is pretty startling, according to the latest report by The Linux Foundation titled, 'Linux Kernel Development: How Fast It is Going, Who is Doing It, What They Are Doing and Who is Sponsoring It.' The report says that over 10,000 developers have been contributing to Linux in the last eight years.

Reportedly, almost 10,000 developers from more than 1,000 companies have contributed to the Linux kernel since 2005, when the tracking actually began. Compare it to the last report and you will realise that the figure back then was about 1,100 developers from 225 companies. Things have improved further with Linux Kernel 3.10, which has seen the highest ever contribution from developers.

In addition, mobile phone and embedded companies are also taking keen interest in Linux. Companies like Linaro, Samsung and Texas Instruments now jointly contribute 11 per cent in comparison to the previous figure of 4.4 per cent.
