

Figure 1: Generated quiz as HTML form

```

44 res.end();
45 });
46 server.listen(8000);
47 console.log('Connect to http://localhost:8000');

```

Here's the explanation of the above script.

Line 1: Include the file system and *http* libraries, which will be used later.

Line 3-6: Variables declaration. *data_lines* is an array to store records from file.

Line 8-14: Read the file and separate each line as a record. Split function makes an array with each line as one element in an array. Line 1 of the input file is the array element with index 0.

Line 17-20: Create a server instance. Write the HTTP header to the browser when a new request comes.

Line 22-24: Write the head of the HTML file based on the first line of the input file.

Line 26-45: Parse Line 2 to the end of the file and split the questions and answers. Prepare the HTML form elements using a checkbox for each answer option.

Line 46: Listen to port 8000. If browser and server are on the same machine, open *http://localhost:8000/* in your Web browser.

Line 47: Details of the URL where the server can be reached.

Now run the program using the command below:

```

$ node node-quiz.js
Connect to http://localhost:8000

```

The output can be seen in Figure 1.

Enhancing the Web application

The above application only displays a quiz questionnaire. But the same can be enhanced for processing the number of right answers and evaluating the scores. To develop a full production grade Web application, Node's popular package Express can be used.
