

Google launches backward-compatible version of Android Action Bar

Google showcased the backward-compatible version of its Android Action Bar at its developer's conference in May. The code for it is now available from Google. The code allows developers to merge the Bar into their newer

and older applications. As Chris Banes from Android's developer team states in his post of August 7, the Action Bar code can be added to existing Android apps as it is backward-compatible.

According to the blog post, Banes says that, "Following on the Android 4.3 and Nexus 7 announcements, we recently released two important tools to help you build beautiful apps that follow Android Design best practices," which include the Action Bar and the full source code for the feature-packed I/O 2013 app. "The ActionBarCompat APIs let you build the essential Action Bar design pattern into your app, with broad compatibility back to Android 2.1," whereas the I/O 2013 code "...gives you working examples of ActionBarCompat, responsive designs for phones and tablets, Google+ sign-in, synchronised data kept fresh through Google Cloud Messaging, live streaming using the YouTube Android Player API, Google Maps API v2, and much more."

Study by SUSE reveals that 83 per cent enterprises use Linux

According to a study commissioned by SUSE, 83 per cent of enterprises have Linux deployed on their servers, the main reasons being lower TCO, higher performance and avoidance of vendor lock-in.

It has been 21 years since Linux was introduced, and it is now most widely accepted and trusted within the many enterprise server environments. Out of the 83 per cent of respondents who are using Linux in their server environments, 40 per cent are either using Linux as their primary server operating system or as one of their top server platforms.

Linux is also the preferred operating system for business-critical applications. Enterprises are either running or planning to run database (69 per cent), data warehousing (62 per cent), business intelligence (62 per cent), CRM (42 per cent) and ERP (31 per cent) applications on Linux servers in the next one year.

According to Richard Fichera, vice president and principal analyst at Forrester Research, "It is apparent ... that Linux has continued to mature nicely as both a foundation for large scale-out clouds as well as a strong contender for the kind of enterprise workloads that previously were only comfortable on either RISC/UNIX systems or large Microsoft Server systems."

KDE 4.11 released in memory of Atul Chitnis

Atul Chitnis

The KDE developer team recently released version 4.11 of the Software Compilation suite and dedicated it to the Indian FOSS hero, Atul Chitnis. As written in the release announcement, "This release is dedicated to the memory of Atul 'toolz' Chitnis, a great Free and Open Source Software champion from India. Atul led the Linux Bengaluru and FOSS.IN conferences since 2001, and both were landmark events in the Indian FOSS scene. KDE India was born at the first FOSS.IN in December 2005. Many Indian KDE contributors started out at these events. It was only because of Atul's encouragement that the KDE Project Day at FOSS.IN was always a huge success. Atul left us on June 3rd after fighting a

taskbar, which has been ported to QtQuick. Many long-standing bugs have been removed, ensuring the software is more consistent in behaviour. A few applets have been improved significantly as well, like the notifier, battery and sound mixer. The latter is now able to control multiple media players like Clementine, Amarok and Tomahawk.

battle with cancer. May his soul rest in peace. We are grateful for his contributions to a better world."

This 11th major KDE 4 release comes improved in different ways. Most notably, it comes with a
