

Figure 1: Dashboard

can search for a *node.js* package called Volo, which does this for you). Let's have a look at some simple HTML code, which displays the string 'HELLO OSFY'. The code is given below:

```
<html>
<head>
  <title>FFOS APP</title>
</head>
<body>
  <p>HELLO OSFY</p>
</body>
</html>
```

Save this in your *myapp* folder as a file named *index.html*. This will be the default view for your application. Now, create a manifest file for the Firefox OS app. A manifest file is simply a JSON formatted file that contains details about your app, like its name, developer details, icon links for your app, permissions that your app will need to access various features of the phone, etc. A sample manifest file has been given below:

```
{
  "name": "OSFYapp",
  "description": "This app is a demo for OSFY!!",
  "launch_path": "/index.html",
  "developer": { "name": "Sahil",
  "default_locale": "en"
}
```

Save this in a file called *manifest.webapp*, in the same *myapp* directory. The simplest way to run your code is to open the Firefox OS dashboard, and click on the button *Add directory*. Now, navigate to your *myapp* directory and select your manifest file. At this point, your app should be visible in the dashboard. The errors and warnings will be displayed alongside your app. Errors, if present, should be resolved before continuing, and warnings may be ignored for now (but should be resolved before publishing your app). To run the app, click on the *stopped* tab in the dashboard, which should result in the Firefox OS Simulator opening. The screenshot is given in Figure 2.

You can use your mouse to interact with the Firefox

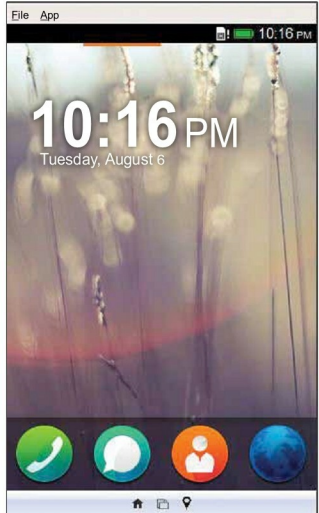

Figure 2: Firefox OS Simulator

OS. Your app should show up on the next screen, and will have the name specified in your manifest file, with the default icon (or the icon you set in your manifest file). Click on it to run your app.

That is all it takes to get a basic app up and running on the Firefox OS. Before we proceed, you should validate your app. You should zip all the contents of your *myapp* folder (not the folder, but its contents). Make sure you have named your manifest correctly, and upload the zip to <https://marketplace.firefox.com/developers/validator>. This step will validate all your work thus far, and will ensure
