

Get to Know REVEAL.JS

Browsers are now available on any OS platform and are ubiquitous across different types of devices such as tablets and mobile phones. With the standardisation of Web technologies and new features available, there are now many browser-based alternatives to the traditional PowerPoint presentation. The power of JavaScript and CSS comes alive when you use Reveal.js, with its 3D CSS transformations and customisable themes.

Slideware is the most common tool used when giving presentations. While the excessive use of slides hinders communication, the right mix of graphics and limited text can make a big impact. To create and make a presentation, you will use an office productivity suite application like Microsoft PowerPoint or OpenOffice Impress. Developing slides using desktop applications has many advantages such as ease of use and reuse of templates. There are also disadvantages, such as document format mismatch, proprietary file formats, large file sizes, etc. Also, the machine on which the slides were created and the machine you then run them on may differ. You will have to ensure that the computer running the slides has the application (Powerpoint or Impress), which may not come as default with the OS or is a paid application.

Hence, today, the use of browser-based slide shows is on the rise. The open source community and the Web developers are switching to cool ways of creating and sharing slides.

There are a dozen tools and Web-based packages that make slide creation easy and also portable across computers.

For Web developers, a browser-based slide show is an excellent option. Developers can show both code and application (rendered) in the same frame. This is something that cannot be done in desktop application software.

This article focuses on the browser-based slide show software-Reveal.js. It is simple to learn and has powerful features. Those who do not understand HTML and CSS can skip the article and directly use the cloud-based slide show software <http://slid.es> which is based on Reveal.js. If you have some knowledge of HTML and CSS, continue the exciting journey.

The basics of Reveal

Reveal is software developed by using Web technologies like HTML, JavaScript and CSS. You create the content as part of a HTML file. To run the slides with features such as
