

Figure 1: First slide with navigation icons

slide navigation, transitions and animation, you will need a few additional files to run on the target computer. Be assured that the number of files and their size is not very large, as most of them are text files. The easiest way to start using Reveal.js is to begin editing the sample HTML files that come with the package. Even if you are not well versed with HTML or CSS, you can create beautiful slides by copy-pasting a few snippets.

To get the Reveal.js software, download the source files using the following commands:

```
/home/janardan> mkdir slides
/home/janardan> cd slides
/home/janardan/slides> git clone https://github.com/hakimel/reveal.js.git
/home/janardan/slides> ls -F
reveal.js/
/home/janardan/slides> cd reveal.js
/home/janardan/slides/reveal.js> ls -lF
css/
examples/
Gruntfile.js
images/
index.html
js/
lib/

LICENCE

package.json
plugin/
README.md
```

Open the file `index.html` in the browser. You will see the sample slides, which give an overview of all the features.

Slide layout and navigation

Every slide has navigation arrows at the bottom right of the

Figure 2: Overview mode to glance through all slides

screen. The presenter can click on the buttons or press the left arrow or right arrow on the keyboard. Interestingly, you can find arrow buttons that are not just right and left, but also up and down. We will come to that later. In addition, there is a coloured bar that appears at the bottom of the slide to indicate the percentage of slides covered.

You can enter the *slideshow mode* in full screen by pressing the 'F11' key for Google Chrome. Reveal also gives a keyboard shortcut of 'f', which is a browser-independent key to enter full screen mode.

When in *fullscreen mode*, you can press 'Alt+Left click' (mouse click) to zoom a portion of the slide. Press again to zoom out. This is very useful when you want the audience to focus on a table or set of values displayed in the slide.

Reveal allows you to enter the *overview mode* to look at all slides in thumbnail view and quickly jump to a particular slide. This is useful both when creating slides and also to glance at the slide's structure.

While you are in the middle of a presentation with the slides projected on the screen, to quickly explain something to the audience on a whiteboard, you might want to 'pause' or 'blank' the slides. This is possible by pressing 'b'.

Writing content

As mentioned earlier, the easiest way to start creating content is by modifying the supplied examples. As the sample `index.html` file comes with all possible transitions, links, images and styles, you just need to clone the slides and modify the content.

Slide: Each new slide is enclosed in `<section>` `</section>` HTML tags. A typical slide contains a heading and body.

Headings: All slides are part of a single HTML. Each slide is enclosed in a HTML tag `<section>`.

The first title slide is a HTML markup tag `<h1>` (which is Header 1). All the following slides will have the second level header `<h2>`. This is a convention and you can feel free to use HTML tags to suit your presentation.

Bullets: As most slides have bullets (unordered or ordered),
