

Figure 3: Presentation mode helps the presenter with upcoming slides and time taken

source licences. You could give just a brief history on one slide and the remaining details of the history can be covered in depth. If there are any questions during the brief history slide, the presenter can go 'down' to the details (by pressing the 'down' arrow).

Presentation view with dual screen: Reveal has a feature in the current version that other presentation software also support in recent versions. When the laptop is connected to a projector, the presenter relies more on the laptop during the presentation. To have continuity and time management, the presenter gets to see the 'Next slide' content, current time and time elapsed as shown in Figure 3. To get this screen, you need to have the presentation run

on a Web server (like XAMPP or WAMP).

Other features: There are many other features to be explored by you after Reveal is up and working. You can select them from existing slide transition styles, change the themes of the slides and also view the slides on a mobile. Reveal also gives you the option to export the presentation as a PDF.

Content creation for non-coders

To use Reveal, you need to 'code' slides for format and slide transitions, which could be a limitation for someone switching from desktop-based applications. The same software with rich features are available on the cloud for non-programmers. Visit <http://slid.es>
