

“The security threat on the cloud is now passé”

With the launch of Oracle 12c, Oracle has introduced the first database designed for the cloud. The Oracle Database 12c brings to customers a new multi-tenant architecture, by which the company attempts to simplify the process of consolidating databases onto the cloud and enable customers to manage many databases as one - without having to change their applications. Oracle has also announced new database-to-storage system capabilities for customers using Oracle Database 12c with Oracle's Sun ZFS Storage Appliance and Pillar Axiom storage systems. The new capabilities enable Oracle database users to optimise database performance, streamline storage configuration and provisioning, and create new development and test environments.

Diksha P Gupta from *Open Source For You* spoke to **Sheshagiri Anegondi, VP, Technology Business at Oracle India**, about the new database and how it will help in addressing the issues faced by IT admins. Read on...
