how open source makes the environment conducive to further development. Actually, before the Paranoid Android 3+ release, it was directly based on Cyanogen Mod sources and only after Android 4.2 was released, was it rebased to develop its own code on top of AOSP. Installation

Installation is like that of any other ROM. If you are not familiar with rooting or customising your phone, you should probably go ahead and read up the innumerable tutorials available online. The process is highly device dependent, and it is not possible to describe the detailed steps. Overall, it just includes flashing a custom recovery, doing a factory reset, installing the latest zip along with the Google Apps package and, finally, a full wipe of the cache and *dalvik* cache. In case you are not sure how to go through these steps, there are YouTube videos aplenty that demonstrate them. Once you are

done with the set-up, you can go through the usual set-up wizard and tutorial on how to use the different features.

Hybrid UI

This is one of the features that very few ROMs provide out-of-the-box. Per App Colour, on the other hand, is a fancy feature that changes the colour of the status bar, according to the app displayed in the foreground.

While you might be able to configure something similar to this on any other ROM, Paranoid Android lets you do it in style, complete with customised preferences
