

What Are Tizen's Chances of a Prime Time Smartphone Entry?

A recent spike in the development of open mobile OSs has led to the release of exotic sounding distributions. An OS that is yet to grab the headlines is one that is mobile-optimised and will begin appearing in mass produced handsets starting this year, according to Samsung. Tizen is the OS in question, and its developers intend it to power a variety of devices including phones and, eventually, tablets, vehicles and televisions.

The Tizen operating system succeeds a number of other mobile-optimised OSs, which for one reason or another have had their cores or certain components migrated or merged into it. The first release of the Tizen SDK 1.0, code named Larkspur, came on the heels of Meego's decommissioning, and integrated large parts of LiMo as well. It featured a DPKG-based software packaging system, the Linux kernel, Enlightenment

Foundation Libraries (EFL) for graphics, and a number of components for connectivity and other features.

The Tizen 1.0 mascot was a friendly smiling genie, and this SDK release was timed to appear at the time of the first annual Tizen developer conference in San Francisco on May 7-9, 2012. By the time the Tizen SDK 2.0 came out, the genie was gone and replaced with the new Tizen 'pinwheel' logo.
