

notice 1006 is unavailable (refer to Figure 4). It is because either the user is not logged in or because the link may be broken. Now Asterisk tries to reach the user of extension 1006 at his Gtalk ID `user-2@gmail.com` and establishes the call as shown in Figure 4.

Important: Even if the user is not in the office, he can still take calls from either Gtalk or the softphone installed on his mobile phone.

Demo – softphone to Gtalk

To demonstrate this call flow in real-time, you will be using the email ID, `rakeshkumar.techie@gmail.com`. All the calls made to extension 300 will be redirected to `rakeshkumar.techie@gmail.com` by `Extensions.conf` as shown in Figure 4.

If the user named 'gtalk' dials 300, the Asterisk server receives the call and redirects it to the Gtalk ID as shown in Figure 5.

Gtalk to softphone

Asterisk also supports redirection of Gtalk calls to mobile phones. For this, the files `jabber.conf` and `gtalk.conf` have to be configured.

Assume that Asterisk is configured to redirect calls of `user-1@gmail.com` to the softphone. When a user `xyz@gmail.com` calls `user-1@gmail.com`, the call is first received by the Asterisk server via the Internet and is validated by `extension.conf` to take the appropriate action. It should be specified in `extension.conf` that, "All incoming calls of `user-1@gmail.com` should be redirected to an Android phone at extension 1002."

Demo – Gtalk to softphone

To demonstrate the above mentioned call flow in real-time, you will use the email ID `asterisktest.gtalk@gmail.com`. All incoming calls to `asterisktest.gtalk@gmail.com` will be directed to extension 300 on the softphone. An incoming call dialogue box appears on the softphone as 'From Google Talk', as in Figure 6.

Overall call flow

Figure 7 illustrates the complete call flow between different platforms like Windows, Linux, Mac and Android. A Gmail user `xyz@gmail.com` calls his friend at `user-1@gmail.com` on Gtalk but `user-1@gmail.com` has configured his Asterisk engine to divert calls to extension 1002 on his Android phone. Since his Android phone is configured with the 3Com* softphone and registered with Asterisk PBX, all his Gmail calls will be redirected to his smartphone via Asterisk PBX Engine.

Similarly, a Linux user - `Linux1` with extension 1000 uses the Twinkle* softphone calls `user – windows` at extension 1006. But this user (`user – windows`) has registered to divert his extension calls to his Gtalk ID at `user-2@gmail.com` 

Footnote:

- [1] 3Com – Android softphone and Mac
- [2] Adore – Windows softphone
- [3] Twinkle – Linux softphone
