

Progressive Web Apps (PWA): Why, Where, and How

Imagine an app that feels as smooth and feature rich as a native app you download from the app store, but works seamlessly in your web browser, on any device. That's the magic of progressive web apps (PWAs). Let's find out how to develop them.

Progressive web apps (PWAs) represent a revolutionary approach to web development, blending the best features of traditional websites and native mobile applications. They are designed to deliver a seamless, app-like experience directly within the web browser, providing users with fast, reliable, and engaging interactions without the need to download and install a separate app from an app store.

Why choose progressive web apps (PWAs)?

There are several reasons why you may choose to develop a progressive web app (PWA) instead of a traditional website or native mobile app. Here are some of the key benefits.

For businesses

- PWAs deliver lightning-fast loading times and smooth interactions,

Creating a PWA means thinking beyond the desktop—designing an experience that thrives on a mobile, tablet, and beyond.

keeping users engaged. Offline functionality ensures a seamless experience even without an internet connection.

- Push notifications allow businesses to send timely updates and reminders, driving repeat visits and fostering stronger user connections.
- PWAs eliminate the need for app store downloads, reducing friction in the user journey and potentially

boosting conversions.

- They benefit from SEO, making them discoverable through search engines, unlike native apps solely reliant on app store discovery.
- PWAs leverage a single codebase for various platforms, streamlining development and potentially lowering costs compared to building separate native apps for each operating system.
- They generally take up less storage space on user devices compared to native apps, making them ideal for users with limited storage or on slower internet connections.

For developers

- PWAs are built using familiar web technologies like HTML, CSS, and JavaScript, minimising the need to learn entirely new programming languages for native app development.
