

Low-Code and No-Code Platforms:

Get Ready for the Future

Software development has received a boost with the emergence of low-code/no-code (LCNC) platforms that allow even those not initiated in coding to create applications in quick time. We take a look at some of the best LCNC platforms in the open source domain.

With skilled software developers in short supply, enterprises are turning to artificial intelligence (AI) and low-code/no-code (LCNC) platforms to get their work done quickly while reducing development costs. Low-code software development uses a platform that requires minimal coding to create software. Low-code platforms are suitable for rapid application development and automating

business processes. No-code software development provides an interface with drag-and-drop functionality to develop applications from various templates and components of pre-programmed software. This helps to create an application without coding. No-code platforms are suitable for small businesses and offer quick solutions.

Gartner predicts that by 2026, developers outside formal IT departments will account for at least

80% of the user base for low-code development tools, up from 60% in 2021. According to IDC, sales of no-code platforms will grow at an annual rate of 13.9% through 2026, with that of low-code platforms growing at 14.1% over the same period.

A market research study published by P&S Intelligence states that the global low-code market will witness a 31.1% CAGR between 2020 and 2030 to reach US\$ 187 billion by 2030.
