

Figure 8: Separated classes

Figure 9: Line graph

Colouring the grid and formatting it can make the graph more understandable and insightful. Seaborn, as we have been seeing, is a very good and creative library. It has many different colour palettes that can be very helpful to make the visualisation more attractive. See the code below (Figure 6).

```
sns.palplot(sns.color_palette("BuGn", 10))
```

We can separate multiple classes using different colours as shown in Figure 7. You can use the code given below for this.

```
sns.relplot(data=df, x="bill_depth_mm", y="bill_length_mm",
hue="island")
```

Figure 10: Histogram

We can also separate classes based on a fourth feature, as shown in Figure 8.

```
sns.relplot(data=df, x="bill_depth_mm", y="bill_length_mm",
hue="island", col="sex", col_wrap=2)
```

There are many other kinds of graphs and visualisations in Seaborn. Let us look at a few of them now. The first one we will be looking at is the line graph. If you are familiar with basic statistics, you would know that a line graph uses lines to connect data points, showing how one data variable changes over a continuous interval of another variable. This can be done with Seaborn using the code given below (Figure 9).
