

Figure 11: Heatmap

Figure 12: Violin plot

Figure 13: Box plot

```
sns.relplot(data=df, x="bill_depth_mm", y="bill_length_mm", kind="line", ci=None)
```

Let us now look at the bar graph. Often referred to as a bar chart, it uses rectangular bars to compare distinct categories or groups of data. Each bar's length represents the quantity of a category, making it effective for illustrating magnitudes and comparisons between different groups. This can be done by using the code given below:

```
sns.set_context('notebook')
sns.barplot(x = 'island', y = 'bill_length_mm', data =
```
