

Figure 18: Overall view of the dataset

```
sns.pointplot(x="island", y="bill_length_mm", hue="sex",
              data=df, palette="PuBu")
```

In some cases, a horizontal bar plot may be more understandable and the following code can be used for it. Refer to Figure 17.

```
sns.barplot(x = 'bill_length_mm', y = 'island', data = df,
            palette = 'PuRd', orient = 'h',
```

If you want to get an overall picture of the entire dataset, you can use the following command. This will generate different paired plots between different features and give us an overall view of the dataset with respect to a category. It can be used with a set of features multiple times to get a full view. Which features are related (and how they are related) can be understood easily as shown in Figure 18.

```
sns.set_style("ticks")
sns.pairplot(df, hue = 'sex', diag_kind = "kde", kind =
            "scatter", palette = "husl")
```

This is it. You now have a basic working knowledge of data visualisation and the open source Seaborn library of Python. You can refer to the official documentation for more details and information. It will help you to get more creative and make beautiful visualisations that anyone can understand easily!! **END** 🐧
