

ESDS to develop AI-powered autonomous cloud platform

Bengaluru-based ESDS Software Solution Limited plans to develop an AI-powered autonomous cloud platform, which will enable enterprises to seamlessly manage, deploy, and transform cloud infrastructure across multiple environments, significantly reducing the need for manual intervention. Leveraging AI and machine learning, the platform aims to provide unified management of IT environments, facilitating automatic data growth, vertical and horizontal autoscaling, operating system management, and application management.

To bring this platform to market, the company plans to hire 300 AI and machine learning engineers over the next few months. This expansion will bolster the current workforce of over 1,100 employees, with new hires distributed across its offices in Nashik, Delhi, Mumbai, Bengaluru, Chennai, and Mohali. While its primary focus remains on India, the company is also making significant strides to establish its presence in the Middle East and the United Kingdom.

The autonomous cloud platform by ESDS is expected to bring a transformative change to how enterprises manage their cloud environments. By integrating AI and machine learning, the platform will not only simplify cloud management but also enhance efficiency and scalability.

Piyush Somani, founder and CEO of ESDS, shared his vision for the platform: “Today’s cloud infrastructure often requires manual intervention for deployment and management. An autonomous cloud platform powered by AI could revolutionise this process. Users could simply select an architecture, deploy it, and then let the system handle everything else.”

Simarpreet Singh, regional sales director, India and SAARC, Sysdig, said, “The public cloud market in India is projected to grow from \$4 billion in 2020 to \$10.8 billion in 2024. Security spending is around 10-13% of IT spending, making it a \$1 billion market. Government initiatives also strongly support cybersecurity. India is also the second largest container market, after the US.”

monitoring tool that detects unexpected behaviour and suspicious activity in real time, providing alerts for potential security breaches or policy violations within containerised applications and infrastructure.

The company views India as a significant market and will engage with government and large enterprise customers to distribute its solutions. “India currently represents about 20% of our ARR (annual recurring revenue) and is projected to be 50% of our new license bookings over the next 12 months,” Selkirk elaborated.

“Our platform, Falco, is the de facto standard for cloud threat detection and response. With over 120 million downloads, it is an open source, rules-based engine constantly updated by customers. It effectively addresses use case problems like crypto-jacking,” said Selkirk, while explaining how the platform resolved threats that could arise with the latest advancements in AI and LLMs.

Falco is an open source runtime security tool for containerised environments, Kubernetes, and Linux. Initially developed by Sysdig, Falco is now part of the Cloud Native Computing Foundation (CNCF). It is a security

Raspberry Pi OS update introduces many UI improvements

The Raspberry Pi Foundation has announced a new update to their Debian-based Raspberry Pi OS for Raspberry Pi single-board computers, focusing on user interface enhancements and new settings. The updated version, 2024-07-04, introduces several significant changes. The panel and PCManFM file manager now support customising more than two desktops. Additionally, the Labwc Wayland window-stacking compositor is now installed by default as an alternative to Wayfire. Labwc can be enabled via the raspi-config utility and features theme settings in the Pixflat theme and configuration support in raspberrypi-ui-mods.

The raspi-config utility has been enhanced with keyboard configuration options and PCIe speed options. The piwiz first-run startup wizard has been updated to allow users to enable or disable Raspberry Pi Connect, which is now also available in the Recommended Software installer, raspi-config, and rc-gui utilities for easier installation and management of remote desktop support. The release includes updates to raspberrypi-ui-mods, adding support for new touchscreens and systemd-
