

inhibit support to override the hardware power key on the Raspberry Pi 5. The raspberrypi-sys-mods package now includes a new *udev* rule for backlight control and a larger swapfile size.

This release also updates the Wayfire Wayland compositor, addressing a crash when opening multiple Xwayland windows and fixing a touchscreen bug. The gui-pkinst installer now features whitelist support for restricting installations to specified packages. The pishutdown helper uses the *kill* command to close the desktop, and the WayVNC VNC server has improved handling of virtual displays and encryption.

The wf-panel-pi panel for the Wayfire desktop now supports smaller screens, better keyboard handling, icon highlighting for taskbar buttons, and proper dialog icons. The release also fixes a potential buffer overflow vulnerability in the PiClone utility, adds brightness control for DSI displays, and enhances virtual display detection in the ARandR utility.

The update is powered by Linux kernel 6.6.31 LTS and includes Chromium 125.0.6422.133 and Mozilla Firefox 126.0 web browsers.

HeatWave GenAI from Oracle is now generally available

Oracle has announced the general availability of HeatWave GenAI, which introduces the industry's first in-database large language models (LLMs), an automated in-database vector store, scale-out vector processing, and the capability for contextual conversations in natural language informed by unstructured content. This allows customers to leverage generative AI for their enterprise data without needing AI expertise or moving data to a separate vector database. HeatWave GenAI is immediately available in all Oracle Cloud regions, Oracle Cloud Infrastructure (OCI) Dedicated Regions, and across clouds at no additional cost for HeatWave customers.

It enables developers to create a vector store for enterprise unstructured content with a single SQL command, using built-in embedding models. Users can perform natural language searches using either in-database or external LLMs. Due to the company's extreme scale and performance, there is no need to provision GPUs, reducing application complexity, increasing performance, improving data security, and lowering costs.

P. Saravanan, VP of cloud engineering at Oracle India, emphasised HeatWave GenAI's potential to revolutionise data management and analysis for Indian

VNC launches secure solution for professional work on mobile phones

VNC has introduced VNCphone, a secure solution for professional mobile work. This new offering addresses the need for privacy and security, spanning hardware, operating systems, platforms, and application modules. The current market is dominated by solutions with questionable security practices, often transmitting sensitive data to unknown recipients without user consent. The company provides a secure alternative with an integrated system that ensures end-to-end security, from device hardware to platform independence. This includes the VNClagoon OS, a Google-free Android operating system, and an optional VPN.

The hardware for VNCphone is based on the Volla Phone, manufactured in Germany, and features dual-boot capability, allowing users to choose between VNClagoon OS, Ubuntu Touch, or Google Android. This makes it suitable for COPE (corporate owned – personally enabled) scenarios, where company-provided devices can also be used privately. It comes with the modular software stack VNClagoon preinstalled. Users can activate applications like VNCtalk, VNCmail, VNCproject, and VNCtask via subscription on the VNC website, enabling immediate mobile collaboration.

Andrea Wörrlein, managing director of VNC in Berlin and board member of VNC AG in Zug, stated, "With VNCphone, there is finally a completely secure package for professional mobile communication and collaboration." This solution is ideal for use in environments where security is critical, such as public and government institutions, critical infrastructures, and security-sensitive companies.
