

To succeed in this dynamic and complex environment, financial institutions need to adopt a cloud-first strategy that enables them to innovate faster, scale on demand, reduce costs, and comply with regulations. However, moving to the cloud is not a simple task, especially for the financial industry, which has unique and stringent requirements and challenges, such as:

- **Security and compliance:** Financial institutions need to protect their sensitive data and transactions from cyberattacks, fraud, and breaches, while meeting the regulatory and compliance standards of different jurisdictions and markets.
- **Performance and reliability:** These institutions need to ensure high availability, low latency, and consistent performance of their critical applications and services, especially during peak periods and market events.
- **Integration and interoperability:** They also need to integrate their legacy systems and applications with modern cloud services and technologies, while ensuring interoperability and compatibility across different platforms and vendors.
- **Customisation and flexibility:** Financial institutions need to customise their solutions and services to meet the specific needs and preferences of their customers, partners, and regulators, while maintaining flexibility and agility to adapt to changing market conditions and customer demands.
- **Skills and resources:** Such institutions need to acquire and retain the skills and resources to design, develop, and manage cloud solutions and services, while overcoming the cultural and organisational barriers to cloud adoption.
