

```
[13] text = "jishnu, jiish, Raj"
     matches = re.findall(r"ji+", text)
     print("Matches:", matches)
```

Matches: ['ji', 'jii']

Figure 8: Functionality of '+'

```
text = "Raj Raaj Raaaj Raaaaj"
matches = re.findall(r"Ra{3}", text)
print("Matches:", matches)
```

Matches: ['Raa', 'Raa']

Figure 9: Functionality of '{}'

```
[17] text = "Raj Raaj Raaaj Raaaaj"
     matches = re.findall(r"(Ra)", text)
     print("Matches:", matches)
```

Matches: ['Ra', 'Ra', 'Ra', 'Ra']

Figure 10: Functionality of '()'

The next character is the '()', which is used to specify a group of characters/regex that we want to verify. This can be tested in the code given below. As we can see in Figure 10, the words that have 'Ra' will be listed out.

```
text = "Raj Raaj Raaaj Raaaaj"
matches = re.findall(r"(Ra)", text)
print("Matches:", matches)
```

We have seen how the major functions and special characters in regular expressions can be used in Python. You can expand on these to build complex regular expressions for identifying emails, addresses, and more. **END** 🐧
