

Red Hat Enterprise Linux AI now available on Azure Marketplace

Red Hat and Microsoft have deepened their collaboration, making Red Hat Enterprise Linux AI (RHEL AI) available on Azure Marketplace. This move offers an optimised platform for deploying AI and generative AI models in Microsoft Azure environments, including a bring-your-own-subscription (BYOS) option.

RHEL AI provides a scalable, consistent foundation for organisations transitioning to AI-driven business practices. It supports the development, testing, and deployment of generative AI models across hybrid cloud environments, leveraging Granite models and InstructLab tooling for model alignment with enterprise data and use cases.

“Red Hat Enterprise Linux AI on Microsoft Azure empowers organisations to scale GenAI deployments with greater confidence and flexibility to act quickly on the opportunities that AI presents for their business today, paving the way for the next wave of innovation tomorrow,” stated Joe Fernandes, vice president and general manager, AI Business Unit, Red Hat.

This expands the long-standing partnership between Red Hat and Microsoft, which has delivered several AI-optimised solutions, including Red Hat OpenShift AI and Azure Red Hat OpenShift.

Jake Zborowski, general manager, Microsoft Azure Platform, Microsoft Corp., said: “We’re pleased to welcome Red Hat Enterprise Linux AI to the Microsoft Azure Marketplace, which gives our partners great exposure to cloud customers around the globe.”

RHEL AI will be available on Azure Marketplace starting December 2024.

Microsoft unveils Hyperlight: An open source, embedded VMM for Linux and Windows applications

Microsoft had earlier announced OpenHCL, a Rust-based open source solution for running confidential Intel TDX and AMD SEV-SNP virtual machines. Now, they are unveiling Hyperlight, another innovative Rust-based project focused on virtualisation.

Hyperlight is a lightweight, embedded virtual machine monitor (VMM) designed to integrate seamlessly with Linux and Windows applications. Tailored for high security and efficiency, Hyperlight facilitates executing isolated, small-scale functions. Each function call runs within its own hypervisor, ensuring robust protection. The library leverages Linux KVM and Microsoft Hyper-V to securely and swiftly isolate individual functions within virtual machines (VMs).

The versatility of Hyperlight makes it applicable across a wide range of scenarios, from cloud computing environments to IoT devices and industrial applications. Microsoft plans to submit the project to the Cloud Native Computing Foundation (CNCF) as a sandbox project, further promoting its adoption in the open source community.

Licensed under Apache 2.0, the Hyperlight codebase supports both Linux and Windows platforms and is now publicly available on GitHub.

VMware enhances AI, security, and sovereignty for the private cloud

Broadcom Inc. has enhanced its VMware Cloud Foundation (VCF) platform to accelerate artificial intelligence (AI) adoption, support digital sovereignty, and bolster cybersecurity for organisations. It has introduced new VCF Advanced Services, expanded partnerships, and added a private cloud modernisation program to enhance generative AI capabilities, cyber resilience, and secure cloud adoption.

Krish Prasad, SVP and GM of VCF at Broadcom, emphasised that VCF’s private cloud infrastructure enables organisations to harness AI, strengthen resilience, and address privacy and digital sovereignty. VCF

offers the scale and agility of public clouds while maintaining the security and control of a private cloud, supporting multi-environment deployment across data centres, hyperscale clouds, and the edge.

The company unveiled VMware Tanzu Data Services for VCF to improve data management and security, essential for AI applications. Tanzu simplifies deployment and management of databases like PostgreSQL and MySQL, providing automated life cycle management and ensuring data security.

VMware Live Recovery now supports Google Cloud VMware Engine (GCVE) as an isolated recovery environment (IRE) for disaster recovery, ensuring seamless security for workloads. VMware vDefend’s new GenAI-based co-pilot feature aids in cyber resilience by reducing false positives and enhancing situational awareness for security teams.

The company’s private AI strategy emphasises secure, adaptable AI services. Through a partnership with Microsoft, Broadcom now supports Azure AI Video Indexer on VMware Cloud Foundation, enabling video and audio analysis using generative AI. This integration helps organisations deploy AI solutions flexibly across their environments.
