

Its robust query language (NRQL) allows for complex searches on data, aiding in the identification of patterns and trends. By creating custom visualisations and dashboards, users can make data-driven decisions, enhance performance, and increase problem-solving proficiency.

Dashboards: New Relic One dashboards enable the creation of customised data visualisations in real-time, providing insights into infrastructure and application performance. With a variety of widgets such as tables, graphs, and charts, users can visually represent key information and performance indicators. Dashboards offer a quick overview of application and infrastructure functionality, facilitating rapid issue identification and resolution.

Applied Intelligence: Applied Intelligence in New Relic One leverages machine learning algorithms to proactively detect and alert users to potential issues. By analysing data to identify trends and abnormalities, it assists in resolving issues before they impact users negatively. Applied Intelligence enhances application reliability and effectiveness by detecting and addressing issues early on.

Full-Stack Observability: Full-Stack Observability provides comprehensive monitoring of applications and infrastructure, offering visibility into every layer of the stack. With capabilities for tracking application performance, infrastructure health, and user experience, users can monitor and improve every aspect of the system. Full-Stack Observability ensures application and infrastructure reliability, scalability, and performance.

Programmability: New Relic One's programmability allows users to enhance its functionality and tailor it to their unique requirements. By leveraging New Relic's APIs and SDKs, users can write custom code to automate procedures, integrate with other systems, and enhance New Relic One's features. Programmability makes New Relic One more versatile and potent, enabling customisation to meet specific needs.

Getting started with New Relic One

Let us explore how to integrate New Relic One into a Spring Boot application.

Create an account on the New Relic One website by visiting <https://newrelic.com/signup>. After signing up, verify your email address by clicking on the verification link sent to your provided email inbox, and then proceed to create a password. Once logged in, navigate to your profile settings. You can find your licence key, which is essential for instrumenting different applications, under the section titled 'API Keys'.

Instrumenting New Relic One into your Spring Boot application

Here's how you can integrate New Relic One into your existing Spring Boot application.

Visit the New Relic website at <https://docs.newrelic.com/docs/release-notes/agent-release-notes/java-release-notes/>. Click on the 'Download the New Java Version' button, which will direct you to a page displaying various zip

Figure 1: Navigate to your profile and go to the section 'API Keys' to view your licence key
