

time period and interval for the signal. Set a time limit cutoff for continuous threshold exceedance.

**Add alert details:** Provide a name for the alert and select a policy. Optionally, create a new policy if required.

**Save and setup notifications:** Click on the 'Save and setup notifications' button to proceed.

**Activate workflow:** Choose the method for receiving alerts, such as email, and activate the workflow.

**Create email destination:** Create a new email destination by providing your email address and saving it.

**Activate workflow:** Activate the workflow to complete the email setup.

**Close and review:** Close the setup and review the alert configuration in the 'Alert conditions' section.

**Test notification:** Optionally, send a test notification to ensure the alert setup is working correctly.

These steps will help you successfully configure alerts in New Relic, allowing you to monitor specific metrics and receive timely notifications when threshold values are exceeded. You should see an alert created in the 'Alert Conditions' section under 'Alerts and AI' as shown in Figure 5.

## Best practices for effective usage of New Relic One

**Optimising performance monitoring:** New Relic One offers a suite of tools and features to optimise performance monitoring effectively.

- **Custom dashboards:** New Relic One's custom dashboard functionality can be leveraged to tailor monitoring to your specific needs. Add widgets to track metrics such as response times, error rates, and throughput.
- **Distributed tracing:** The platform's distributed tracing capabilities can be used to trace requests across your microservices architecture. Identify performance bottlenecks and optimise your application's performance accordingly.
- **Application performance monitoring (APM):** You can gain detailed insights into your application's performance with New Relic One's APM. Access transaction traces, error analytics, and application dependencies to pinpoint issues and optimise performance effectively.
- **Maximising the value of data insights:** To extract maximum value from your data insights, follow these practices.
  - **Data visualisation:** Harness New Relic One's robust data visualisation tools, including charts, graphs, and heatmaps, to visualise data and derive valuable insights.
  - **Custom charts and dashboards:** Create custom charts and dashboards within New Relic One to visualise specific metrics and trends relevant to your business goals.
  - **Advanced analytics:** Utilise advanced analytics features like NRQL to perform complex queries and analyses on your data. This enables you to derive deeper insights and make informed decisions.
- **Ensuring scalability and reliability:** To ensure
