

Q. What kind of partnerships does Google Cloud have within the open source community?

A. We collaborate with open source partners at every level within the Google Cloud Vertex AI platform. For instance, we integrate third-party models from Meta, specifically the Llama models, into the Vertex AI platform. Users also have the option to use non-Google models, such as Anthropic and those available on Hugging Face.

Within Vertex AI, users can perform extensive customisations, including adapter tuning, and enjoy flexibility in deployment. Models can be deployed using Vertex AI, BotX, or even on your infrastructure with GKE, Google's Kubernetes engine. GKE doesn't require Google's infrastructure, as Kubernetes allows you to deploy on your own setup. This extensive flexibility extends across all layers—from infrastructure and platform to application—and Vertex AI integrates these options.

Q. What advice would you like to give to developers who want to upskill themselves using AI?

A. We're entering an era of continuous learning, where new skills will need to be acquired every few months, and agile learners will likely be more successful. Hands-on development skills as well as core skills in coding and software development are still very important. I would also emphasise staying up-to-date with new APIs and trying them out. In terms of open source tools, I recommend starting with Google Cloud's learning resources. We offer a variety of free courses, including hands-on labs through Qwicklabs, which are very effective for hands-on learning. If you're serious, consider the certification for Professional Machine Learning Engineer. These structured learning paths can help you approach the field systematically; otherwise, the volume of content out there can be overwhelming.

Q. Do you consider these pointers when hiring new recruits?

A. A strong foundation in technology and a passion for learning are really important. Many of our hires come from data analytics or infrastructure backgrounds and then upskill in AI, especially in areas like GPU tuning and AI-enhanced security. So, if you're a software developer, consider upskilling with AI in your domain, which can make you more versatile and valuable.

Q. What brings you to Open Source India?

A. We're here because we believe the vibrant developer community in India will drive substantial progress in AI for companies worldwide. I encourage everyone at the conference to embrace AI learning and innovation to advance both the technology and the country in the next wave of global innovation. **END** 🐼
