

CREW: Open source platform to improve human-AI interaction

As human-AI collaboration deepens, critical questions arise: How should humans and AI complement one another? What kind of feedback enhances AI training? How can trust in AI be optimised to balance collaboration without over-reliance?

Researchers at Duke University are addressing these challenges through CREW—an innovative platform designed to advance human-AI teaming. “The goal is to harness the strengths of both humans and AI to create dynamic, adaptable collaborations,” explained Professor Boyuan Chen, director of the Duke General Robotics Lab. Published in the *Transactions of Machine Learning Research*, CREW offers a robust toolkit to study and improve human-AI interaction across disciplines.

CREW stands out for its unique approach. Unlike platforms focusing solely on AI performance, CREW prioritises the human element. It provides pre-built games—such as bowling, treasure hunting, and hide-and-seek—alongside customisable tasks. These activities enable researchers to explore how humans and AI can collaborate effectively. A standout feature is its real-time feedback system, where users offer nuanced responses via a gradient scale, significantly enhancing the AI’s adaptability and training speed.

The platform also integrates advanced interfaces to capture passive physiological data, including eye movements, brain activity, and heart rate. This comprehensive dataset provides profound insights into human-AI interaction, paving the way for more intuitive and effective collaboration frameworks.

CREW goes a step further with cognitive tests that assess traits influencing teamwork efficiency. A study involving 50 adults revealed that skills like spatial reasoning and quick decision-making impact collaboration success. These findings could lead to targeted human training programs and adaptive AI systems that strengthen teamwork.

Fully open source, CREW invites global researchers to innovate in human-AI collaboration. Future updates will expand tasks, support multiplayer strategies, and refine physiological data analysis.

Helical Insight 5.2.2 released

Helical Insight, a leading name in open source business intelligence (BI), has unveiled its latest version, Helical Insight 5.2.2. Packed with significant enhancements and new features, this release aims to empower users with a more robust, flexible, and user-friendly BI experience.

One of the standout updates in version 5.2.2 is the enhancement of the tabular report experience. Users can now manage column widths dynamically, providing greater control over report layouts. Additionally, column alignment settings ensure that data is presented precisely the way users want it, improving readability and customisation.

Performance has also seen a notable boost. The caching mechanism in this release has been refined, leading to faster report rendering and seamless user interactions. This improvement particularly benefits enterprises that handle large datasets and need real-time insights.

The new version includes enriched charting capabilities, offering users access to more visualisation options. These updates provide advanced customisation features that make charts more interactive and tailored to specific business needs. The API ecosystem has been expanded, enabling deeper integrations and smoother automation workflows. Developers will appreciate the streamlined access to extend the platform’s functionality.

Security remains a priority in this release while maintaining compliance with global standards. Enhanced access control features give administrators granular control over user roles and data visibility. Being an open source platform, Helical Insight continues to champion community-driven development. With this release, users and developers alike are encouraged to contribute further enriching the platform’s capabilities and fostering innovation.
