

Figure 1: Webacula GUI interface

Use the following command to configure the Bacula file:

```
[root] vi /etc/bacula/bacula-fd.conf
# line 19 : set password for File daemon
Password = "OSFY"
[root] systemctl enable --now bacula-fd
```

Running Bacula backup

To create and manage backups in Bacula, first define and configure resources in Bacula's configuration files, and then execute backup jobs. To access the Bacula console, use the following command:

```
[root] bconsole
$list jobs //list available jobs
$run //Run the backup job
```

Bacula will prompt you to confirm the job.

```
Automatically selected Catalog: OSFY
Using Catalog "OSFY"
A job name must be specified. Enter job name: OSFY-1
```

Select the job and run the command:

```
[root] 25 /tmp
```

Follow the prompts to select the job, client, and other options.

Once the backup has started, you can monitor the backup process in the *bconsole*:

```
[root] status director
```

Restoring files in Bacula

Restoring files in Bacula involves several steps, including identifying the backup job, selecting the files to restore, and executing the restore operation. But before you do that:

- Ensure that the director, storage daemon, and file daemon services are operational.
- Verify that you have access to the Bacula console (*bconsole*).
- Ensure that the secondary storage device is accessible.

You can choose from different options when restoring your files.

Option 1: Restore your most recent backup.

Option 2: Restore a backup before a certain date and time.

Option 3: View and choose from a list of available backups.

Option 4: Restore particular files.

```
[root] bconsole

# start restore task (Job)
*restore
$ ls
$ mark home
$ lsmark
$ done
# run restore job
OK to run? (yes/mod/no): yes
[root] l5 /tmp/bacula-restores/home
# backup data restored
```

Adopting Bacula as an open source backup solution reflects a commitment to protecting your most valuable asset — your data. Bacula's proven reliability, cost-effectiveness, and scalability put us in a good position to reduce risk, improve productivity, and maintain business continuity in an increasingly data-driven world. **END** 🐧
