

The Transportation dataset covers 86 million kilometres of roads worldwide and is already in use by early adopters like Microsoft, Meta, and TomTom for their mapping applications. With the GA release, the data and its underlying schema are now stable, providing developers with the ability to integrate this data into their applications. As a result, many more companies and application developers are

expected to adopt the Overture Transportation dataset as the foundation for various use cases.

“The Transportation layer of Overture is an iconic map data layer used across a wide range of applications. It is also the most complex, and I’m pleased to see it hit the

GA milestone so quickly,” said Marc Prioleau, executive director of the Overture Maps Foundation. “The team’s work now lets any application developer take advantage of this dataset and deliver services to businesses and consumers around the world. Overture data is built open and free for anyone to use, so we expect many innovative use cases across industries, organisations, geographies, and future mapping efforts.”

This dataset joins other Overture datasets—such as those for buildings, points of interest, divisions (boundaries), and base layers—that have also reached GA. However, the Transportation dataset stands out as potentially the most impactful in terms of its use cases and was the most complex to develop, according to the company. This complexity arises from the intricate relationships within road networks and the vital role transportation plays across multiple sectors.

The dataset includes detailed and accurate information derived from aerial imagery, clear road routes with recognisable highway signs, comprehensive rail and ferry routes, and improved handling of complex traffic rules and restrictions. Starting with OpenStreetMap (OSM) data, Overture Maps Foundation re-engineered the structure to create a more stable dataset, complete with a documented schema, making it easier for application developers to utilise.

AmiViz partners with Sandfly Security to enhance Linux security solutions in the Middle East

AmiViz, a leading value-added distributor of cybersecurity solutions in the Middle East, has announced an exclusive partnership with Sandfly Security, a global leader in agentless Linux security. This collaboration aims to deliver Sandfly’s state-of-the-art intrusion detection and threat-hunting solutions to enterprises across the Middle East and Africa (MEA), addressing the region’s growing need for robust cybersecurity amidst critical infrastructure development and digital transformation efforts.

Leveraging AmiViz’s extensive distribution network and expertise in advanced cybersecurity solutions, this partnership expands Sandfly Security’s footprint in the MEA region. Sandfly’s innovative agentless platform, designed specifically for Linux environments, detects intrusions, malicious activity, and advanced persistent threats (APTs) without requiring any software installation on host systems. This low-impact, efficient approach ensures businesses can secure their Linux systems without compromising operational performance.

“Linux environments are the backbone of critical sectors such as finance, healthcare, and government, yet they often remain under-protected. Sandfly Security’s unique approach to securing these systems is a game-changer,” said Ilyas Mohammed, chief operating officer at AmiViz. “By partnering with Sandfly, we are empowering enterprises in the MEA region with cutting-edge tools to defend against increasingly sophisticated cyber threats.”

The collaboration enhances AmiViz’s cybersecurity portfolio by enabling organisations to monitor Linux servers in real time and respond proactively to emerging threats. It also addresses the increasing reliance on Linux in cloud computing, data centres, and IoT ecosystems, where traditional security tools often fall short.

By introducing advanced Linux security solutions, the collaboration aims to protect critical systems and data in an era of escalating cyber threats. “We are thrilled to partner with AmiViz to bring our Linux security solutions to the dynamic and rapidly evolving MEA market,” said Craig Rowland, founder and CEO at Sandfly Security. “This partnership will enable us to address the pressing security needs of Linux systems across a wide range of industries, ensuring that organisations can safeguard their data and operations with confidence.”
