

Building Cross-Platform Mobile Apps with Ionic

Mobile apps are an intrinsic part of daily life today – we use them to order food, groceries, taxis, and more. As these apps need to work across platforms, developers are focusing on cross-platform app development so that they code only once to create apps that function on multiple platforms. Ionic is a framework that can help developers build apps faster than with native app development, while saving them time and money. Let's learn how to install and deploy it.

Developers can use HTML, CSS, and JavaScript to construct mobile apps with the Ionic framework. Developed by Drifty Co. (now a member of the Ionic team), it offers a collection of tools and UI components optimised for mobile devices to assist in creating superior cross-platform applications.

Pre-requisites for working with Ionic

In order to work with Ionic, you should possess some basic understanding of and proficiency with the following.

- **HTML, CSS, and JavaScript**

HTML: Recognise how to use HTML to organise web pages.

CSS: Understand the fundamentals

of responsive design and web page styling.

JavaScript: Because Ionic uses Angular (or React/Vue), which depends on JavaScript, knowledge of JavaScript is essential.

- **Angular (or) React**

Angular: Since Angular is the most widely used framework for Ionic, it
