

GNOME 46.7 offers greater stability and usability

The GNOME Project has announced the release of GNOME 46.7, the seventh maintenance update in the GNOME 46 ‘Kathmandu’ desktop environment series. This update brings numerous bug fixes, updated translations, and other enhancements, aiming to improve stability and usability.

Arriving one-and-a-half months after GNOME 46.6, GNOME 46.7 includes key updates such as enhanced accessibility for the keyboard backlight toggle in Quick Settings, a default preference for GPUs with built-in panels as the primary GPU, and a switch from real-time to high-thread priority for the Kernel Mode Setting (KMS) thread.

The release also addresses several issues, including ensuring frame events are sent for cursor surfaces, adding support for the BGRX8888 format on Big Endian systems, fixing graphical artifacts in partially-rounded buttons in GNOME Shell, resolving touchscreen drag-and-drop problems on Wayland, and addressing cursor glitches with virtual monitors and immediate updates after window drags.

GNOME Initial Setup has been updated to version 46.7, featuring improvements to the time zone page, which now avoids duplicate entries for certain cities, and GTK 4.17 support, which prevents startup crashes. Other updated components include GNOME Online Accounts 3.50.7, which resolves a deadlock with cancelled tasks; libsoup 3.4.5, addressing potential NULL dereference, overflow, and assertion issues; and gnome-user-docs 46.7, which includes refreshed translations.

Users of the GNOME 46 desktop environment series are encouraged to update to version 46.7 as soon as it becomes available in their distribution’s stable repositories.

Vision kit, powered by the Qualcomm QCS6490 processor. Additional Ubuntu images are in development for broader Qualcomm IoT platforms. The beta is open to all, allowing developers to download and flash the image onto the RB3 Gen 2

Vision kit via the Qualcomm IoT Platforms portal.

The Ubuntu image will enable regulatory compliance with long-term maintenance, updates, and enterprise-grade software. Lifecycle management, a robust ecosystem, and commercial support for maintaining and scaling applications are other benefits.

This collaboration strengthens the partnership between Canonical and

Qualcomm. By embedding Ubuntu and Ubuntu Core into the company’s devices, developers can create secure, high-performance applications for industries like retail, robotics, and edge automation. With support for up to 12 years, optimised Ubuntu images will address the needs of AI at the edge and broader IoT sectors, ensuring security, compliance, and operational efficiency.

“Canonical is committed to making Ubuntu the trusted OS for diverse devices, SoCs, and platforms,” said Cindy Goldberg, VP of Silicon Alliance at Canonical. “This release is a pivotal step in redefining AI and IoT deployments using Qualcomm systems.”

“This beta delivers an out-of-the-box Ubuntu experience for developers using the Qualcomm RB3 Gen 2 Vision kit and QCS6490 processor. It accelerates development, shortens time-to-market, and enhances AI scalability,” said Leendert van Doorn, senior vice president, Qualcomm Technologies.

Kali Linux 2024.4 released

Offensive Security has announced the release of Kali Linux 2024.4, the latest stable ISO snapshot of this Debian-based rolling distribution designed for ethical hacking and penetration testing. Built on Linux kernel 6.11 and retaining the Xfce 4.18 desktop environment as the default, this release comes three months after its predecessor, Kali Linux 2024.3. It introduces several significant updates, including Python 3.12 as the default interpreter, support for the latest GNOME 47 desktop
