

Linux Lite 7.0 officially released

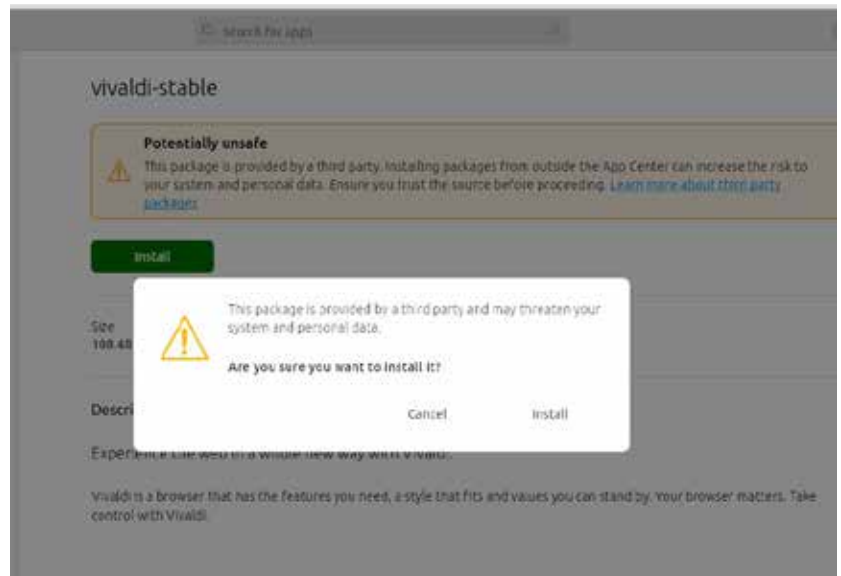

Jerry Bezencon, the developer behind Linux Lite, has announced the release and general availability of Linux Lite 7.0, the newest iteration of this Ubuntu-based distribution that utilises the lightweight Xfce desktop environment.

Dubbed ‘Galena’, Linux Lite 7.0 is built upon the Ubuntu 24.04 LTS (Noble Numbat) operating system series and incorporates the latest Xfce 4.18 desktop environment. It operates on the Linux 6.8 kernel series, ensuring modern hardware compatibility and performance enhancements.

This version updates several key components, including Google Chrome 125.0 as the standard web browser, VLC 3.0.20 for media playback, LibreOffice 7.6.7 as the office suite, Mozilla Thunderbird 115.11.0 (packaged as a Snap) for email and calendar management, and GIMP 2.10.36 as the image editor/viewer. Additionally, Linux Lite 7.0 introduces an improved installer with new, more informative slides designed to enhance the installation process, particularly for first-time users. The release also features an updated Lite Welcome app. “The theme of this series is maturity. We’ve been offering Linux Lite now for 12 years and, in that time, have integrated many features as suggested by the community as well as building upon a solid and secure foundation,” said Bezencon.

The visual design of Linux Lite remains consistent with its previous series, as Linux Lite 7 continues to utilise the Materia window theme along with the Papirus icon theme and the Roboto Regular font. This release also introduces Secure Boot support, catering to users who wish to install Linux Lite alongside Windows. For more detailed information about this release, visit the release announcement page. There, you can also download Linux Lite 7.0 from a selection of global mirrors. It’s important to note that upgrading from existing Linux Lite 6.x installations or from the RC version to Linux Lite 7.0 is not possible.

to right-click the file and select to open it with the App Center application. For security, the App Center will warn users that the package may be unsafe and to ensure they trust its source before proceeding with installation.

This functionality is currently available in the edge channel of the App Center (snap-store) and includes a fix for previously reported issues such as being unable to update all snaps at once.

Oliver Smith, Canonical’s interim engineering director for Ubuntu Desktop, has also announced that updates to the App Center will soon be notified to users via an alert message, indicating that updates will apply automatically once the application is closed.

Additionally, Canonical has made updates to the Ubuntu Desktop installer, enhancing the error message clarity for the experimental hardware-backed full disk encryption option in Ubuntu 23.10 and adding support for local file paths in the ‘Automated Install’ option.

IPFire Linux firewall update adds experimental support for the Btrfs file system

The IPFire Project has announced an update to their hardened open source GNU/Linux distribution, which is primarily used as a router or firewall. The latest release, IPFire 2.29 Core Update 186, includes various updates and introduces

experimental support for the Btrfs file system, exploring new possibilities for system management and resilience.

The IPFire 2.29 Core Update 186 features an updated kernel based on Linux 6.6.30 LTS. This update provides mitigations for the latest Register File Data Sampling (RFDS) vulnerability, also known as CVE-2023-28746, which affects Intel processors. Additionally, it includes CPU frequency scaling support for Raspberry Pi and enhanced CPU graph support, which improves the visualisation of processor performance when some virtual cores are offline.
